## COAXIAL AND WAVEGUIDE MEASUREMENT ACCESSORIES

HEWLETT ho PACKARD

## COAXIAL <br> AND WAVEGUIDE <br> MEASUREMENT <br> ACCESSORIES

## introduction:

The pages that follow contain complete information about Hewlett-Packard's extensive line of high frequency measurement accessories. These coaxial and waveguide products, which enjoy worldwide accpetance for quality and precision, perform significant functions in virtually all high frequency measurement applications. This extensive listing represents but one facet of Hewlett-Packard's total capability.
Hewlett-Packard manufactures more than 2,000 electronic products ranging from basic test instruments to elaborate computational systems. In addition to our state-of-the-art electronic test instruments such as oscillators, voltmeters, counters, and oscilloscopes, HP manufactures computers, scientific calculators, medical electronics, and analytical instruments. HP's high frequency product lines range from microwave devices (e.g., transistors, diodes) and components (e.g., switches, mixers) to multi-function computer-controlled instrumentation systems.

In developing a broad line of state-of-the-art instrumentation, HP has also made numerous contributions to measurement technology. In the area of high frequency measurements, HP has pioneered the use of swept measurements and complete phase/amplitude-characterization of high frequency networks. These were made practical through such development as high directivity multihole directional couplers, precision slotted lines, and rotary vane attenuators. Other high frequency measurement contributions include precision solid-state signal generators and sweepers; fully calibrated spectrum analyzers, and high accuracy power meters. HP's reservoir of measurement technology is available from an extensive library of application notes and video tapes. Direct applications assistance is no further away than the nearest telephone. In addition to 20 domestic and international manufacturing facilities, HP maintains over 170 worldwide sales and service offices in 65 different countries. The field offices are staffed by trained engineers, each of whom has a primary responsibility of helping you solve measurement problems.
The quality of the products described here is the same HP quality that has become a standard in the electronics industry. Each product is designed for high stability, wide applicability, convenient size, and simplest possible operation. Highest quality components and materials are used in construction and utmost care is taken in manufacture. Advanced techniques of swept frequency and computercontrolled testing are used to assure that each item meets or exceeds its specifications.
general information:

## HOW TO USE THIS LISTING:

The products being presented have been grouped into thirteen product categories. Each category has convenient index tabs for rapid access. A supplementary HP model number index begins on Page 4. Within each product section waveguide product specifications are shaded in blue to provide visual distinction from the coaxial product listings. The overall summaries (waveguide accessories on page 61 and coaxial items on page62) indicate, at a glance, the availability of products in any given frequency range.

## HOW TO ORDER:

Products should be ordered by name and HP model number. Your Hewlett-Packard field engineer can advise you on the availability of special options or features. Your order should be made out to the Hewlett-Packard Company and sent to the nearest Hewlett-Packard field office.

## PROCESSING AND SHIPMENT OF YOUR ORDER:

Hewlett-Packard's customer commitment extends to efficient order processing. From any point in our worldwide organization, orders are transmitted daily over special communication lines directly to the appropriate manufacturing facility. Most of the items listed here are available for same-day shipment.

## WARRANTY:

These Hewlett-Packard products are all warranted against defects in materials and workmanship for one year from the date of delivery. We will repair or replace products which prove to be defective during the warranty period.

## microwave measuring techniques

Hewlett-Packard offers a complete line of microwave test equipment from which systems can be assembled for making accurate reflection, transmission and frequency measurements. Equipment ranges from inexpensive CW systems which measure a magnitude response to powerful network analyzers which furnish a dynamic CRT display of frequency swept magnitude and phase. Measurement techniques and equipment functions are discussed briefly in the following paragraphs. More detailed information is available in Application Notes 64, 65, and 84, complimentary copies are available from Hewlett-Packard sales offices.

## FREQUENCY MEASUREMENTS

There are two general classes of frequency measuring devices-active and passive types. Electronic counters, transfer oscillators, and frequency converters are examples of active types. HP manufactures a complete line of these instruments which measure frequency well into the microwave region with accuracies of a few parts in $10^{8}$.

Where the accuracy of active devices is not required, passive devices offer direct readout at a considerable saving in cost. Passive transmissiontype frequency meters, such as the HP 532, 536A, and 537A, are two-port devices that absorb part of the input power in a tunable cavity. When the cavity is tuned to resonance, a dip occurs in the transmitted power level. This dip can be observed on a meter or oscilloscope display of the detected RF voltage. Frequency is then read from a calibrated dial driven by the cavity tuning mechanism.

The accuracy of cavity frequency meters depends upon the cavity Q, dial calibration, backlash, and effects of temperature and humidity variations. The Hewlett-Packard waveguide and coaxial passive frequency meters achieve accuracies of a few parts in $10^{4}$.

## IMPEDANCE MEASUREMENTS

Impedance-matching a load to its source is one of the most important considerations in microwave transmission systems. If the load and source are mismatched, part of the power is reflected back along the transmission line toward the source. This reflection not only limits maximum power transfer, but also can be responsible for erroneous measurements of other parameters or even cause circuit damage in high-power applications.
The signal reflected from the load interferes with the incident (forward) signal, causing standing waves of voltage and current along the line. SWR which is the ratio of standing wave maxima to minima is directly related to the impedance mismatch of the load. The standing wave ratio (SWR), therefore, provides a valuable means of determining impedance magnitude and mismatch.
There are two common methods for measuring

SWR; slotted line techniques and reflectometer techniques. A slotted line measures the ratio of standing wave maxima to minima while a reflectometer separates the incident and reflected voltage waves and then measures their ratio.

## Slotted Line Techniques-Single Frequency

Standing-wave ratio can be measured directly with a slotted line in a setup like the one shown in Figure 1. The slotted line probe is loosely coupled to the RF field in the line, thus sensing relative amplitudes of the standing-wave pattern as the probe is moved along the line. The ratio of maxima to minima (SWR) is displayed directly on the SWR meter.

FIGURE 1. Typical setup for SWR measurements in coax.
Slotted lines feature low residual SWR (high directivity) and have the capability of inexpensive phase measurements compared to reflectometer techniques. While these methods works well for single-frequency testing, they are time-consuming for broadband applications.

## The Swept Slotted Line

A measuring system which combines the speed and convenience of swept-frequency measurements and the inherent accuracy of the slotted line can be built around the HP 817A Slotted Line System. The setup is identical to Figure 1 except that the source is replaced with a sweep oscillator, the slotted line is an 817A option H03, and the 415E is replaced by the HP 8755A/181A. This system will operate throughout the frequency range from 1.8

Figure 2. Multi-sweep slotted-line measurement.
Vertical scale $0.5 \mathrm{~dB} / \mathrm{cm}$.

## microwave measuring techniques

continued
to 18 GHz . The measurement results are displayed on a storage oscilloscope as an envelope of the SWR in dB. See Figure 2. At any given frequency, the ratio of the maximum and minimum amplitude of the envelope is the SWR. A plot of SWR can be generated in a few seconds and retained on the CRT for evaluation or photography. Accuracy of slotted-line measurements is limited primarily by the residual SWR of the line itself, 1.01 in waveguide and 1.02 to 1.06 in coax depending upon the frequency and type of connector.

## Reflectometer techniques

The reflection coefficient ( $\rho$ ) of a device or system is another useful term in establishing the impedance match of microwave devices. The following relationships of $\rho$ and SWR are frequently used in impedance work:
$\rho=\frac{\left|E_{\text {reflected }}\right|}{\left|E_{\text {incident }}\right|}=\frac{S W R-1}{S W R+1}$
Reflection coefficient ( $\rho$ ) is a linear quantity varying between zero and one. The logarthmic expression of $p$ is known as return loss and defined as: $\mathrm{dB}=-20 \log _{10}|\rho|$. A reflection coefficient of 1.0 (total reflection) therefore, corresponds to a return loss of 0 dB and a zero reflection coefficient corresponds to infinite dB return loss. For example, if the reflected signal from a test device is 26 dB below the incident signal level, the reflection coefficient of the device is calculated as 0.05 .

The load reflection coefficient is measured by separating the incident and reflected waves propagated in the transmission line connecting the source and load. The reflectometer uses either coaxial or waveguide couplers to accomplish this separation. Reflectometers permit dynamic oscilloscope displays or permanent $\mathrm{X}-\mathrm{Y}$ recordings of reflection coefficient or return loss across complete operating bands.
The waveguide reflectometer setup shown in Figure 3 is designed to hold the incident power constant by leveling. With automatic leveling, only the relative amplitude of the reflected wave need be measured to determine reflection coefficient.
To calibrate the reflectometer, a short circuit is placed at the output port, thus reflecting all of the incident power (zero dB return loss). The detector in the reverse-arm coupler samples the reflected power and provides a proportional dc voltage for readout. By placing a calibrated attenuator ahead of the detector specific amounts of return loss may be pre-inserted for calibrating the recorder gain. The attenuator is then returned to zero, the short removed, and the test device connected and measured on the pre-calibrated display. Measurements are also possible without the pre-insertion attenuator if the detector remains within its square law region.

FIGURE 3. Typical waveguide reflectometer.
The reflectometer technique described is an economical way for making swept measurements (See HP Application Note 65 for more information). However, greater speed and convenience is possible with the HP 8755 Series Frequency Response Test Sets. These sets make precision measurements of return loss (SWR) over a continuous 60 dB dynamic range compared to the 25 dB square law range of most crystal detectors. Measured data can be either plotted on an $\mathrm{X}-\mathrm{Y}$ recorder or read directly from a fully calibrated CRT display. See Figure 5 and Hewlett-Packard Application Note 155.

Accuracy of reflectometer measurements is limited by directional coupler directivity. A residual SWR of 1.02 ( 40 dB directivity ( is common in waveguide and 1.02 to 1.1 in coax depending on the frequency range and connectors.

## ATTENUATION MEASUREMENTS

Attenuation is defined as the decrease in power (at the load) cuased by inserting a device between a $Z_{0}$ source and load. Under this condition, the measured value is a property of the device alone. The term $Z_{0}$ is used to describe a unity SWR condition where the load and source impedances equal the transmission line impedance.
There are three common methods for measuring RF attenuation: 1) square-law detection with audio substitution, 2) direct RF substitution, and 3) linear detection with IF substitution. Accurate square-law measurements and RF substitution are possible using crystal detectors such as the HP 423A coaxial, and 424A waveguide series.

## Square-law detection technique

Figure 4 shows a waveguide system for swept attenuation measurements of 25 to 30 dB . Source power is leveled using a single 752-series 10 dB directional coupler in the ALC loop. Coupling variation versus frequency in the leveling loop causes leveled power variations of about 1 dB at the point of test device insertion. This power variation is

FIGURE 4. Swept attenuation system for measurements up to 30 dB .
nearly equal to, but opposite, the coupling variation of the readout coupler. Therefore, grid lines are plotted to remove the frequency response error and increase measurement resolution.

With the 8620A sweeping the frequency range of interest, a zero-dB reference level is established on the $x-y$ recorder without the test device in the system. The device is then inserted as indicated in Figure 4 and its attenuation versus frequency determined by the amplitude decrease from the reference level previously established.

FIGURE 5. Setup for simultaneous swept measurement of insertion gain/loss and return loss.

A much improved square-law detection technique uses the HP 8755L Frequency Response Test Set. The setup diagram in Figure 5 permits simultaneous measurements of attenuation and return loss over a continuous 60 dB dynamic range. Readout is either on a CRT display calibrated directly in dB or a $X-Y$ recorder. The 8755A is plug-in compatible with the 180 Series oscilloscopes and has a frequency range of 100 MHz to 18 GHz .

## RF substitution technique

Swept attenuation measurements up to 45 to 50 dB can be made using the RF pre-insertion, X-Y recorder system shown in Figure 6. Coupler tracking and detector errors are eliminated by plotting a calibration grid on the X-Y recorder prior to the actual measurement. The grid is plotted by setting in specific values of attenuation
on the 382A near the anticipated test device attenuation and triggering single 30 -second sweeps. The 382A is then set to 0 dB and the test device inserted as shown in Figure 6. A final sweep plots attenuation of the test device over the calibration grid.

## IF substitution technique

The IF substitution technique of attenuation measurement involves conversion of the microwave frequency to a constant, much lower frequency for which very accurately calibrated attenuators are available. Detection at a constant IF frequency improves the system sensitivity permitting measurements over a wide ( $>60 \mathrm{~dB}$ ) dynamic range. Both the HP 8405A Vector Voltmeter and HP 8410A Network Analyzer shown on page 10 use these IF signal processing techniques. The 8405A measures the absolute level of two signals and the phase difference between them on a CW basis from 1 to 1000 MHz . Phase accuracy is 1.5 to 3.0 degrees and voltage accuracy $\pm 2 \%$ to $\pm 6 \%$ of full scale depending on the frequency and amplitude range settings.
The 8410 Family of instruments display amplitude and phase information of reflection coefficient, return loss, attenuation, or gain on a swept frequency basis in the range from 110 MHz to 40 GHz . The 8410 Family includes a complete set of test sets for making both waveguide and coaxial component measurements over a continuous 60 dB dynamic range. This equipment features a maximum IF attenuator accuracy of $\pm .2 \mathrm{~dB}$ and a dynamic CRT display of all measured quantities. Compared to a slotted line these systems have a much improved accuracy and readout of phase information. Compared to the other techniques mentioned in this section they offer the latest in speed, measurement precision, and user convenience.

FIGURE 6. RF pre-insertion technique for swept attenuation measurements.

## associated instruments

8405A Vector Voltmeter-The 8405A tuned voltmeter measures the absolute level of two signals and the phase difference between them on a CW basis from 1 MHz to 1000 MHz

8620/8690 Series Sweep Oscillators-The HP family of sweep oscillators provides swept measurements in both solid state and BWO technologies in the frequency range of 10 MHz to 40 GHz .

** See Accessories section, page 53
$\ddagger$ Dimension given is length only.

## advantages:

- HIGH RESOLUTION, EASY-TO-READ DIAL
- direct reading
- broadband
- ACCURACY SPECIFIED OVER $20^{\circ} \mathrm{C}$ AND O TO 100\% RELATIVE HUMIDITY

* As read on a 416 Ratio Meter or 415 SWR Meter calibrated for square law detectors. See HP Catalog for details on these instruments.
+ The 420 B contains a selected crystal and video load; both are installed to achieve best response from 1 to 4 GHz , but unit is usable from $10 \mathrm{MHz}-12.4 \mathrm{GHz}$
$\diamond$ Below 1 GHz , RF may leak through output connector; leakage may be eliminated by using a low pass filter.
** Detectors are not supplied; may use 1N21 or 1 N23 crystal for maximum detection sensitivity where SWR is not critical.
$\ddagger$ Dimension given is length only.
Options: $423 \mathrm{~A} / 8470 \mathrm{~A}$; 001 Matched pair frequency response characteristics track within $\pm 0.2 \mathrm{~dB}$ per octave $10 \mathrm{MHz}-8 \mathrm{GHz} \pm 0.3 \mathrm{~dB} 8.12 .4 \mathrm{GHz} \pm 0.6 \mathrm{~dB} 12.4-18 \mathrm{GHz}$
$423 \mathrm{~A} / 8470 \mathrm{~A} ; 002$ Less than $\pm 0.5 \mathrm{~dB}$ variation from square law up to 50 mV peak output into $>75 \mathrm{~K} \Omega$; sensitivity typically $>0.1 \mathrm{mV} / \mu \mathrm{W}$
$423 \mathrm{~A} / 8470 \mathrm{~A} ; 003$ Positive polarity output.
8470A; 012 Stainless steel Type N male input connector.
470A; 013 Stainless steel Type $N$ female input connector.
8471A; 004 Positive polarity output
8471A; 005 Negative polarity output; $75 \Omega$ input impedance.
8471A; 006 Positive polarity output; $75 \Omega$ input impedance.

## NOTES/TERMINOLOGY:

Impedance: The performance of the 10514 and 10534 is specified for $50 \Omega$ source and load imped ances. The mixers also work well at other impedance levels, including both $75 \Omega$ and $93 \Omega$.
Conversion Loss: Conversion loss is the power ratio between the available input power at the " $R$ " port and the power delivered in one of the output sidebands ("L" input $=+7 \mathrm{dBm}$ ). Conversion loss is not strongly dependent on the available power at the " L " port when this is above 0 dBm .
Noise Performance: For difference frequencies above 50 kHz , noise performance is specified in terms of the relative signal-to-noise ratios at the " $R$ " and " X " ports (i.e., noise figure). The low frequency (1/f) noise contributed by the mixer is specified by the rms noise voltage at the " $X$ " port in a 1 Hz bandwidth centered at 10 Hz

INTERNAL INTERFERENCE (dB) $\dagger$

| Product | $\mathbf{1 0 5 1 4 A}$ | $\mathbf{1 0 5 3 4 A}$ | Product | $\mathbf{1 0 5 1 4 A}$ | $\mathbf{1 0 5 3 4 A}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $2 f_{L} \cdot f_{R}$ | 30 | 40 | $2 f_{R}-f_{L}$ | 65 | 65 |
| $3 f_{L}-2 f_{R}$ | 70 | 65 | $3 f_{R}-2 f_{L}$ | 65 | 65 |
| $4 f_{L}-3 f_{R}$ | 70 | 65 | $4 f_{R}-3 f_{L}$ | 85 | 90 |
| $5 f_{L}-4 f_{R}$ | 90 | 85 | $5 f_{R}-4 f_{L}$ | 90 | 90 |
| $6 f_{L}-5 f_{R}$ | 95 | 90 | $6 f_{R}-5 f_{L}$ | 100 | 95 |
| $7 f_{L}-6 f_{R}$ | 100 | 95 | $7 f_{R}-6 f_{L}$ | 100 | 95 |

Conversion Compression: Conversion compression describes the increase in conversion loss that occurs as the input to the " $R$ " port is increased in level. "Compression by $f_{R}$ alone" implies that $f_{R}$ is a single frequency input. "Compression by $f_{R 2}$ interfering with $f_{R 1}$ " describes the decrease in $f_{L}$ ${ }^{+f_{R 1}}$ as $f_{R 2}$ is increased in level.
Internal Interference: Ideally a mixer produces only sum and difference frequencies of the local oscillator and receive frequencies. Internal interference refers to the higher order mixing products generated when single frequency inputs are impressed on " $R$ " and " L " ports.
Balance: A double balanced mixer suppresses the "R" port signal appearing at both "L" and "X" ports. Similarly the " $L$ " port signal is suppressed at both " $R$ " and "X" ports. In addition, when used as a modulator, the "X" port signal is suppressed at both "L" and "R" ports. The balance specification describes how effective this suppression actually is.

* Residual Attenuation is also referred to as Insertion Loss.
+ Measured with +5 volts bias.
Driven by HP 8403 Modulator. Refer to HP general Catalog for details on this instrument.
** Radiated leakage limits are below those specified in MIL-I-6181D at input levels less than 1 mW
at all input levels radiated interference is sufficiently low to obtain rated attenuation.
$\ddagger$ Level of RF signal appearing at the bias port is typically 50 dB below the level of signals applied to either RF port.

## X930A WAVEGUIDE SHORTING SWITCH

Reflection Coefficient: <0.01 (1.02 SWR, 40 dB return loss) in "open" position; >0.984 (125 SWR, 0.14 dB return loss) in "short" position.

Insertion Loss: Less than 0.05 dB in "open" position.
Fits Waveguide Size:
Nominal O.D. (in.): $1 \times 1 / 2$.
EIA: WR 90.
Frequency Range: $8.2-12.4 \mathrm{GHz}$.
Dimensions (maximum envelope):
Length (flange to flange): $3^{11 / 16}$ in. ( 94 mm ).
Height: $23 / 8$ in. $(60 \mathrm{~mm}$ ).
Width: $41 / 4 \mathrm{in}$. ( 108 mm ).
Weight: Net, $1 \frac{1}{4} \mathrm{lbs} .(0,6 \mathrm{~kg})$. Shipping, $2 \mathrm{lbs} .(0,9 \mathrm{~kg})$.

## 8761A/B COAXIAL SWITCH

Characteristic impedance: 50 ohms.
Frequency range: dc to 18 GHz .
Standing-wave ratio: looking into one of the connected ports with 50 ohms (or built-in termination) on the other, third port open.

| Frequency | Connector type |  |  |
| :--- | :---: | :---: | ---: |
|  | 7-mm | N | 3-mm (SMA) |
| dc-12.4 GHz | $1.15(1.20)$ | $1.20(1.25)$ | $1.25(1.30)$ |
| dc-18 GHz | $1.20(1.25)$ | $1.25(1.30)$ | $1.30(1.35)$ |

SWR in parenthesis applies to switch with built-in termination.
These specifications apply when connected ports are of the same connector type for mixed connector types, the larger of the two VSWR's applies. N-connector VSWR specifications apply to Option 4 connectors.

Insertion loss: $<0.5 \mathrm{~dB}, \mathrm{dc}-12.4 \mathrm{GHz} ;<0.8 \mathrm{~dB}, \mathrm{dc}-18 \mathrm{GHz}$.
Isolation: $>50 \mathrm{~dB}, \mathrm{dc}-12.4 \mathrm{GHz} ;>45 \mathrm{~dB}, \mathrm{dc}-18 \mathrm{GHz}$.
Power: safety handles 10W average, 5 kW peak, without built-in termination; built-in termination rated at 2 W average, 100 W peak.
Switching energy: 1.5 W for 20 ms (permanent magnet latching).
Solenoid voltages (dc or pulsed): 12-15 V, $8761 \mathrm{~A} ; 24-30 \mathrm{~V}, 8761 \mathrm{~B}$.
Switching speed: $35-50 \mathrm{~ms}$ (includes settling time).
Life: >1,000,000 switchings.
Dimensions: $1.6 \times 1.5 \times 1.5 \mathrm{in}$. $(41 \times 38 \times 38 \mathrm{~mm})$, excluding connectors and solenoid terminals.

Weight: net 5-8 oz (140-220 gm); shipping, 8-11 oz (220-300 gm).

Ordering Information
Specify solenoid voltage and connectors (including built-in 50 ohm termination) by the alphabetic suffix on the switch model number and the appropriate three-digit option number.

A: 12-15V; B: 24-30V

| Option <br> Code | Connector Type | Option <br> Code | Connector Type |
| :---: | :---: | :---: | :---: |
| 0 | N Jack | 4 | $7-\mathrm{mm}$ for UT-250 Coax |
| 1 | N Plug | 5 | 3-mm Jack |
| 2 | $7-\mathrm{mm}$ Jack | 6 | 3-mm Plug |
| 3 | $7-\mathrm{mm}$ Plug | 7 | 50 Termination |

"Jack" identifies the connector with fixed threads; "plug" identifies the connector with the coupling nut.

## 10515 A FREQUENCY DOUBLER

Frequency Range: $0.5-500 \mathrm{MHz}$ input $1-1000 \mathrm{MHz}$ output

Impedance: 50 ohm nominal (source and load)
Input Signal Voltage: $0.5-3.0 \mathrm{~V}$
Input Signal Power: 180 mW (maximum)
Conversion Loss:*
$<13 \mathrm{~dB}$ (typically $<11 \mathrm{~dB}$ ) for $>1$ volt
$<14 \mathrm{~dB}$ (typically $<12 \mathrm{~dB}$ ) for $>0.5$ volt

Suppression of 1st and 3rd Harmonic of Input:*
$>30 \mathrm{~dB}$ for 0.5 to 50 MHz input (typically $>35 \mathrm{~dB}$ )
$>10 \mathrm{~dB}$ for input to 500 MHz (typically $>15 \mathrm{~dB}$ )
Dimensions: Diameter: 0.7" (18 mm)
Length: $2.5^{\prime \prime}$ ( 64 mm )
Connectors: Input: BNC male Output: BNC female

Weight: approximately 2 ounces ( 56 grams)

With a 50 ohm resistive load and a single input frequency. Suppression values are referred to the desired output level.

## ADAPTERS

Option: 013 Furnished with stainless steel Type N female connector.

## WAVEGUIDE STAND AND CLAMPS

## 11540A Waveguide Stand

HP 11540A Waveguide Stands are cast and machined from zinc alloy. They are designed for 11541A through 11548 A Waveguide Clamps and lock the clamps at any height from $23 / 4^{\prime \prime}$ to $51 / 4^{\prime \prime}(70$ to 133 mm$)$. The 11540 A is $21 / 2^{\prime \prime}(64 \mathrm{~mm})$ high, and its base measures $43 / 4^{\prime \prime}$ (121 mm) in diameter. Shipping weight, $1 \mathrm{lb} .(0,9 \mathrm{~kg})$.

## Waveguide Clamps

These Clamps consist of a plastic molding. They are offered in 7 sizes to fit waveguide equipment covering frequencies from 2.6 to 40.0 GHz . They are designed for use with the 11540A Waveguide Stand, and when mounted in the stand can be adjusted upward or downward to conform with a waveguide set-up.

## CABLE ASSEMBLIES, AIRLINES, JOINTS, AND FLEXIBLE WAVEGUIDES

10501A Cable Assembly
$44^{\prime \prime}$ of 50 coaxial cable terminated on one end only with UG-88C/U BNC male connector.

10502A Cable Assembly
$9^{\prime \prime}$ of 50 coaxial cable terminated on both ends with UG88C/U BNC male connectors.

## 10503A Cable Assembly

$4^{\prime}$ of 50 coaxial cable terminated on both ends with UG88C/U BNC male connectors.

11086A Cable Assembly
$24^{\prime \prime}$ of 50 coaxial cable terminated on both ends with UG$88 \mathrm{C} / \mathrm{U}$ BNC male connectors.

11500A Cable Assembly
$6^{\prime}$ of specially treated 50 coaxial cable terminated on both ends with UG-21D/U Type N male connectors.

## 11501A Cable Assembly

$6^{\prime}$ of 50 coaxial cable terminated with UG-21D/U Type $N$ male and UG-23D/U Type N female connectors.

## 11606A Coaxial Rotary Air Line

Frequency Range: dc to 12.4 GHz .
SWR: <1.1
Insertion Loss: $<0.5 \mathrm{~dB}$.
Uncertainty Vector: -57 dB (due to rotation).
Connectors: ${ }^{1}$ One 7-mm plug and one 7-mm jack.
Dimensions: $315 / 16$ in. $\times 3 / 4$ in. $\times 3 / 4$ in. $(100 \times 19 \times 19 \mathrm{~mm})$.
Net Weight: $51 / 2$ oz ( 154 gm ).
Shipping Weight: $1 \mathrm{lb}(0,45 \mathrm{~kg})$.

## 11588A Coaxial Rotary Joint

Frequency Range: dc to 12.4 GHz .
SWR: <1.1
Insertion Loss: $<0.5 \mathrm{~dB}$.
Uncertainty Vector: -57 dB (due to rotation).
Connectors: One precision $7-\mathrm{mm}$ jack and one standard APC-7.
Dimensions: $15 / 8$ in. $\times 25 / 16$ in. $\times 13 / 16$ in. $(42 \times 59 \times 30 \mathrm{~mm})$.
Net Weight: 8 oz ( 224 gm ).
Shipping Weight: 10 oz ( 280 gm ).

[^4]
## 11605A Flexible Arm

Impedance: 50 ohms.
Reflection Coefficient of Ports: $\leqslant 0.11$ (1.25 SWR), DC to 12.4 GHz.

Connectors: Hybrid, APC-7*
Insertion Loss: $\leqslant 2.5 \mathrm{~dB}, \mathrm{DC}$ to 12.4 GHz .
Weight: $4 \mathrm{lb}(1,8 \mathrm{~kg})$ net.
Length: 10.1 in . ( $256,5 \mathrm{~mm}$ ) closed, 25.5 in . ( $647,7 \mathrm{~mm}$ ) extended.

## 11675A Leveling Cable Assembly

Length: 6 ft (1828,8 mm).
Construction: RF (RG-214) cable and leveling cable covered with single sheath.
Connectors: Male BNC's for leveling cable, Male Type N for RF cable.

## 11503A Flexible Waveguide

Frequency: $12.4-18.0 \mathrm{GHz}$.
Typical VSWR: 1.1
Connectors: WR-62.
Length: 12 inches ( 305 mm )
Weight: $1 / 2 \mathrm{lb}(0,45 \mathrm{~kg})$ net.

11504A Flexible Waveguide
Frequency: $8.2-12.4 \mathrm{GHz}$.
Typical VSWR: 1.1
Connectors: WR-90.
Length: 12 inches ( 305 mm ).
Weight: $1 \mathrm{lb}(0,90 \mathrm{~kg})$ net.

11566A Airline Extension
Impedance: 50 ohms.
Frequency: DC-18 GHz.
Reflection Coefficient: . $018+.001$ (freq. in GHz).

Connectors: APC-7.
Length: 10.25 cm .
Weight: $1 / 2 \mathrm{lb}(0,45 \mathrm{~kg})$ net.

## 11567A Airline Extension

Impedance: 50 ohms.
Frequency: DC-18 GHz.
Reflection Coefficient: . 018 + . 001 (freq. in GHz).

Connectors: APC-7.
Length: 20.25 cm .
Weight: $1 / 2 \mathrm{lb}(0,45 \mathrm{~kg})$ net.

| Dimensions (in/mm): |  | $\begin{gathered} 45 \times 6 \times 1^{1 / 2} \\ (119 \times 152 \times 38) \end{gathered}$ | $\begin{gathered} 45 \times 6 \times 1 \frac{1 / 2}{2} \\ (119 \times 152 \times 38) \end{gathered}$ | $\begin{gathered} 55 / 8 \times 31 / 2 \times 1 \\ (143 \times 89 \times 25) \end{gathered}$ |
| Weight ( $\mathrm{lbs} / \mathrm{kg}$ ): |  | $2^{3 / 8} / 1,1$ | $2^{3 / 8} / 1,1$ | 13/16/0,37 |
| Options Available: |  | 001 | 001 | 001, 002, 003 |

* Unit has four snap-on dials, two for bipolars and two for FET's.
$\dagger$ Unit has two snap-on dials for bipolars.
Stripline width: 0.082 inch; material: PPO-0.031 inch thick.
** Must specify one option when ordering.

Options: $11600 \mathrm{~B} / 11602 \mathrm{~B}$; 001 Precision Type N connectors for input and output.
1608A, 001 includes blank gounding and clamping inserts for custom machining
002 Accepts T0-51 package ( $0.250^{\prime \prime}$ dia.)
003 Accepts H-Pac 200 package ( $0.205^{\prime \prime}$ dia.).
All units, except 11608A, opt 001 are supplied with a short circuit termination calibrator and a $50 \Omega$ through line calibrator.
