DUAL CHANNEL DC AMPLIFIER MODEL 150-2000

IM-150-2000-1

## INSTRUCTION MANUAL

MODEL 150-2000

#### TABLE OF CONTENTS

Paragr	aph	Page
l	Functional Description	l
2	Tabulation of Characteristics	l
3	Operation: General Procedures	2
4	Operation: Starting the Dual Channel DC Amplifier	2
5	Operation: Calibrating the Dual Channel DC Amplifier	2
6	Operation: Recording with the Dual Channel DC Amplifier	3
7	Maintenance: Adjusting the DAMPING control	3
8	Maintenance: Channel Identification	4
9	Maintenance: Tube Da <b>t</b> a	4
10	Maintenance: Fuse Data	4
11	Maintenance: Indicator Data	5
12	Maintenance: Plug-in Capacitor Data	5
13	Haintenance: Signal Connector Data	5
14	Maintenance: Name Plate Location	5

MODEL 150-2000

#### 3. OPERATION: GENERAL PROCEDURES

There are three basic procedures in operating the Dual Channel DC Amplifier:

- STARTING: This includes the warmup period and connecting the signal. See paragraph 4.
- CALIBRATION: An accurate recording depends on proper calibration. The standard procedure is given. See paragraph 5.
- OPERATION: After starting and calibrating, the operation is straight-forward. See paragraph 6.

#### 4. OPERATION: STARTING THE DUAL CHANNEL DC AMPLIFIER

- Set each RANGE switch to OFF and each POWER switch to ON. Allow
  5 minutes warmup for best stability.
- 2. Connect each signal with Amphenol 2-contact plug, Sanborn No. 10B2-1FW. Terminal 1 is the signal terminal, and terminal 2 is ground. Note that the signal source impedance must be small in comparison with 1.15 megohms if the source impedance is to be neglected.

#### 5. OPERATION: CALIBRATING THE DUAL CHAINEL DC AMPLIFIER

- After warmup, make available an accurately measured d-c calibration voltage between two volts and 200 volts as convenient, from a source having the same impedance as the signals to be recorded, if this impedance is not negligible with respect to 1.15 megohms.
- Set the RANGE VOLTS/CM switch to approximately half the calibration voltage.
- 3. Apply the calibration voltage, and adjust the GAIE control for a deflection represented by the formula:

Deflection = Calibration voltage RANGE setting

MODEL 150-2000

#### 6. OPERATION: RECORDING WITH THE DUAL CHANNEL DC AMPLIFIER

- 1. After warmup and calibration, set the RANGE switch to OFF and set the stylus base-line with the POSITION control. If the signal has both positive and negative values, set the stylus near midscale. If the signal is of one polarity only, set the stylus near one edge of the recording chart.
- 2. Now turn the RANGE switch to the right until the signal gives a reasonable stylus deflection, and start the Recorder in motion. Set the STYLUS TEMP control for the best definition. Normally a slight increase in temperature improves the definition when recording high frequencies. Writing the RANGE setting and paper speed on the chart avoids confusion when interpreting the record later on.

#### 7. MAINTENANCE: ADJUSTING THE DAMPING CONTROL

This adjustment may be required after extended operation, or after a tube or other component is replaced.

- 1. Apply a square voltage pulse to the input with a voltage supply, potentiometer, and switch circuit.
- 2. Adjust the potentiometer and the RANGE switch for one centimeter of deflection when the signal pulse circuit is closed.
- 3. Adjust the DAMPING control for the best possible square wave on the recording.

MODEL 150-2000

#### 11. MAINTENANCE: INDICATOR DATA

Symbol Type Function

Sanborn No.

I 2001 NE-51 Indicates that primary power is applied 30B-1 to the Dual Channel DC Amplifier.

#### 12. MAINTENANCE: PLUG-IN CAPACITOR DATA

Symbol	Type	Function	Sanborn No.
С2005, А, В, С	450 volt insu-	Section A: filter for +360 volt plate supply to V2003, V2004. Section B: filter for +360 volt plate supply to V2006, V2007. Section C: not used.	572-217
		Sections A and C: filter for -3.5 volt supply to POSITION controls. Section B: filter for +270 volt plate supply to V2002, V2005.	572-217
C2007 A, B, C	450 volt insu-	Sections A, B, and C: filter for -270 volt supply to cathode return of V2002, V2005.	572-217

#### 13. MAINTENANCE: SIGNAL CONNECTOR DATA

Description	Sanborn No.

Amphenol 2-contact plug, mates with INPUT socket. 10B2-1FW

#### 14. MAINTENANCE: NAME PLATE LOCATION

In case of maintenance problems beyond the scope of this manual, contact Sanborn Company or your nearest Industrial Representative. Give the serial number on the nameplate of your Dual Channel DC Amplifier. This name plate is on the rear chassis wall, and is visible by opening the rear door of the cabinet. SANBORN COMPANY 175 WYMAN STREET WALTHAM 54, MASS. TEL: TW-4-6300 MARCH 9, 1960 REPLACEMENT PARTS LIST RPL-150-2000-2

#### SYSTEM TROUBLE CHECK

#### SANBORN 150 SYSTEM

#### RECORDER

#### DUAL CHANNEL DC AMPLIFIER

Save time by first finding where the fault is, by following these steps in sequence

1. IS THERE ACTUALLY A FAULT?

Check the operator's technique - try the measurements again - see that the oper tor isn't trying something the system isn't built for - check line voltage and frequency.

2. IS THE FAULT IN THE GALVANOMETER?

Power OFF: Check that there is no roughness when moving writing arm with finge.

- Power OFF: Measure galvanometer coil resistance at galvanometer cap. Should be in vicinity of 3200 ohms.
- Power ON: Measure voltage across galvanometer coil at the galvanometer cap. Check that 32 volts change in this voltage gives approximately 10 millimeters of stylus deflection (12.5 divisions on narrow Permapap
- 3. IS THE FAULT IN THE DUAL CHANNEL DC AMPLIFIER?

Connect a low test voltage into one channel of the instrument and then into the other channel. (Voltage from a 1.5 volt flashlight battery is suggested.) If either channel is defective, and the other channel is normal, check tubes in the defective channel. If both channels are defective or dead, check rectifier Y200 and the fuse F2001.

4. DID THESE STEPS POINT OUT THE TROUBLE?

By now, you should have made a start at localizing the source of trouble. If not, the trouble may be system-wide, or may be impossible to track down by this method. What to do: use the Trouble Shooting Chart and Check Charts.

#### TROUBLE SHOOTING CHART

#### SANBORN DUAL CHANNEL DC AMPLIFIER

#### MODEL 150-2000

This chart assumes that the fault has been traced to the Dual Channel DC Amplifier.

SYMPTOM	POSSIBLE CAUSE	CHECK			
Fuse blows each time instrument turned on.	Defective tube	Check V2001			
	Defective condenser	Check plug-in condensers C2006, C2007, also C2001			
	Defective transformer	Check T2001, T2002			
	Wrong size fuse	Must be 1.25 A \$10-Blo			
Does not work; tubes do not light	Blown fuse	Check F2001			
	Loose connectors	Check that power connectors P2002, P2003 at chassis top and rear are firmly in place			
Tubes light, but no oper- ation all channels	Defective tube	Check V2001			
	Loose connectors	Check that signal circuit connectors into J2004 and J2005 are firmly in place			
No operation one channel only, other channel normal	Defective tube	Check tubes in defective channel			
· · · · ·	Loose connector	Check that signal circuit co nector into J2004 or J2005 is firmly in place			
	Open resistor	Check R2001 or R2002, R2010, R2011			
POSITION control will not move stylus over entire recording channel	Defective tube	Check tubes in defective channel(s), including recti- fier V2001			
	Defective condenser	Check C2011			
	Matched resistor pairs out of tolerance	Check matched resistors			
	No negative bias voltage	<b>Check Y2001, R2005,</b> C2007A,B			

SYMPTOM	POSSIBLE CAUSE	CHECK			
Stylus stays at one side of recording channel while instrument on	Defective tube	Check tubes in defective channel(s)			
Instrument on	Leaky condenser	Check all mica condensers			
	Signal overload	If stylus returns to normal with ATTENUATOR at OFF, trouble probably coming in from outside the instrument			
Erratic stylus motion	Intermittent tube	Check all tubes			
	Intermittent rectifier	Check Y2001			
	Loose tube, plug-in, or connector	Press in tightly			
	Erratic signal	Check signal with meter and oscilloscope			
	Intermittent circuit element	Check with meter and oscil- loscope for intermittent circuit element			
Low sensitivity	Defective tube	Check all tubes			
	Improper operation	Check operating technique			
Non-linear	Defective tube	Check all tubes			
	No negative bias voltage	Check Y2001, R2003, C2007A,			
	Mica condenser	Check mica condensers - lea age across or through them can alter grid bias			
	Low line voltage	Check that line voltage is within limits			
	Defective circuit element, giving incorrect circuit voltages	Quick check: measure for approximately #130 volts at 6V6 grids for quick check c proper operating voltages			
	Signal	Signal having high-frequenc components or fast pulses n not show on the recording, but still drive tubes into non-linear region			

#### SYMPTOM

Drift

#### POSSIBLE CAUSE

#### CHECK

See Recorder Trouble Shootin

Check with meter and oscillo scope. See if baseline drif

Drifting widely or outside limits can cause drift. Che

Warm up at least the stated

Inadequate warmup

Drift in high-frequency signal component

Unsatisfactory frequency or transient (overshoot) response, or cannot adjust damping control(s)

Unsatisfactory control of trace density

Noise, microphonics, or hum

as a drift if the high-frequency component drifts. Chec with meter and oscilloscope Defective tube Improper adjustment Leakage Leakage across (or through)

R2009-C2004 or R2023-C2010. If dirty, clean with carbon tetrachloride or equivalent

See the Recorder Trouble Shooting Chart

Defective tube Check all tubes Defective component Check circuit with oscilloscope to find source of inte: ference Noisy signal Check signal with oscilloscop See if baseline becomes clear with ATTENUATOR at OFF. Loose input plug or con-Plug in firmly nector Open shield connection, Check input circuit cabling or ground loop

- 4 -

Quick check:

For a quick check on operation, set POSITION to mid-scale and measure from grid (terminal 5) to ground of each 6V6 stage. Should be approxi mately #130 volts to indicate normal operation of entire channel. (Test at 115 volt line.) Then measure from terminal 5 of one 6V6 to terminal 5 of the other 6V6 in the same channel; should not be more than a few volts, to show normal operation.

#### PERIODIC MAINTENANCE

#### SANBORN DUAL CHANNEL DC AMPLIFIER

#### MODEL 150-2000

This is recommended every 500 hours of operation, or every 3 to 6 months, as determined by experience.

- Replace the 6V6GT tubes in each channel V2003, V2004, V2006, V2007. Use a commercial tube replacement, or use Sanborn replacement no. 68A-4.
- 2. Replace the 5R4GY tube in the power supply V2001. Use a commercial tube replacement, or use Sanborn replacement no. 68A-43.
- 3. Inspect above-chassis for loose tube, controls, plug-in components, and connector

4. Inspect below-chassis for loose resistors, condensers, terminal boards, etc.

- 5. Look for evidence of overheated components check visually and by smell for burn insulation, transformers, resistors, condensers, etc.
- 6. Look for frayed or burned-away insulation.
- 7. Check for dents, panel scratches, corrosion, and other mechanical abuse.

8. Blow out dust and dirt with an air hose.

9. Go through the steps of the Check Chart.

- 5 -

#### CHECK CHART

- 1. Warm up Dual Channel DC Amplifier at least five minutes. Line voltage at 115 volts. Perform following tests on each channel of the instrument.
- 2. Check that POSITION control will move stylus across entire recording channel. Set stylus 20 divisions above bottom of chart.
- 3. Insert signal from 1.5 volt flashlight battery and series switch. Set RANGE swit to 1 VOLT/CM and GAIN control full right. Check for at least 17 mm. stylus deflection (21 divisions with narrow-channel Permapaper). Set GAIN for 15 divisions deflection.
- 4. Intermittently operate switch and adjust DAMPING control for best possible squar wave on the recording. Leading edge of square wave should have fast rise, with no overshoot.
- 5. Insert signal from audio oscillator, with Dual Channel DC Amplifier channel set to 10 divisions peak-to-peak recording. Response should be as shown on characte istic curve in Instruction Manual.
