CERTIFICATION

THE HEWLETT-PACKARD COMPANY CERTIFIES THAT THIS INSTRUMENT WAS THOROUGHLY TESTED AND INSPECTED AND FOUND TO MEET ITS PUBLISHED SPECIFICATIONS WHEN IT WAS SHIPPED FROM THE FACTORY.

Ⓟ FURTHER CERTIFIES THAT ITS CALIBRATION MEASUREMENTS ARE TRACEABLE TO THE NATIONAL BUREAU OF STANDARDS TO THE EXTENT ALLOWED BY THE BUREAU'S CALIBRATION FACILITY.

SECTION I GENERAL INFORMATION

1-1. DESCRIPTION.

1-2. The Hewlett-Packard Model 203A Variable Phase Function Generator is a low frequency function generator which provides two sine wave and two square wave test signals at frequencies from 0.005 cps to 60 kc. (Refer to paragraph 1-5, Options Available.)

1-3. The four test signals are provided at the front panel OUTPUT connectors at an open circuit signal level of 30 volts peak-to-peak. The sine wave and square wave test signals provided at the REFERENCE PHASE OUTPUT connectors are fixed in phase and provide a reference phase for the test signals at the VARIABLE PHASE OUTPUT connectors. The variable phase test signals are continuously variable from 0° to 360° lag with respect to the phase of the reference test signals. The amplitude of the four output signals can be varied with individual continuously variable 40 db attenuators (AMPLITUDE controls.)

1-4. The output terminals are floating with respect to ground and can be used to supply an output voltage with either terminal grounded or can be floated up to 500 volts dc above chassis ground. The output impedance for all four test signal outputs is 600 ohms.

1-5. OPTIONS AVAILABLE.

1-6. Options 01 and 02 are available to provide two additional frequency ranges to the Model 203A. Option 01 includes one additional Decade Module Board Assembly which extends the lower limit of the frequency range from 0.005 cps to 0.0005 cps. Option 02 includes two additional Decade Module Board Assemblies which extend the lower limit of the frequency range from 0.005 cps to 0.00005 cps. These two options can also be installed as a field modification (see Section VI for stock number of Decade Module Board Assemblies).

1-7. APPLICATIONS.

1-8. The Model 203A can be used for phase shift measurements, vibration studies, servo applications, medical research, distortion measurements, geophysical problems, subsonic and audio testing.

1-9. INSTRUMENT IDENTIFICATION.

1-10. Hewlett-Packard uses a two-section eight-digit serial number(000-00000). If the first three digits of the serial number on your instrument do not agree with those on the title page of this manual, change sheets supplied with the manual will define differences between your instrument and the Model 203A described in this manual.

1-11. If an E or G prefixes the serial number, the instrument was manufactured in Europe (E for England, G for Germany).

NOTES

SECTION II INSTALLATION

2-1. INSPECTION.

2-2. This instrument was carefully inspected both mechanically and electrically before shipment. It should be physically free of marks or scratches and in perfect electrical order upon receipt. To confirm this, the instrument should be inspected for physical damage in transit. Also check for supplied accessories, and test the electrical performance of the instrument using the procedure outlined in paragraph 5-3. If there is damage or deficiency, see the warranty on the inside rear cover of this manual.

2-3. POWER REQUIREMENTS.

2-4. The Model 203A will operate from either 115 or 230 vac, 50-1000 cps. The instrument can be easily converted from 115 to 230 volt operation by changing the position of the slide switch, located on rear panel, so that the designation appearing on the switch matches the nominal voltage of the power source.

2-5. THREE-CONDUCTOR POWER CABLE.

2-6. To protect operating personnel, the National Electrical Manufacturers' Association (NEMA) recommends that the instrument panel and cabinet be grounded. All Hewlett-Packard instruments are equipped with a three-conductor power cable which, when plugged into an appropriate receptacle, grounds the instrument. The offset pin on the power cable three-prong connector is the ground wire.

2-7. To preserve the protection feature when operating the instrument from a two-contact outlet, use a three-prong to two-prong adapter and connect the green pigtail on the adapter to ground.

2-8. INSTALLATION.

2-9. The Model 203A is fully transistorized; therefore no special cooling is required. However, the instrument should not be operated where the ambient temperature exceeds 55°C (140°F).

2-10. RACK/BENCH INSTALLATION.

2-11. The Model 203A is initially shipped as a bench type instrument (unless ordered specifically as a rack type) with plastic feet and a tilt stand in place. Conversion to a rack-mounted instrument can be accomplished by using the rack mounting kit and instructions furnished with your instrument.

2-12. REPACKAGING FOR SHIPMENT.

2-13. The following is a general guide for repacking an instrument for shipment. If you have any questions, contact your local  Sales and Service Office (see maps in Appendix for location).

a. Place instrument in original container if it is available. If original container is not available, it can be purchased from your nearest  Sales and Service Office.

If original container is not used,

b. Wrap instrument in heavy paper or plastic before placing in an inner container.

c. Use plenty of packing material around all sides of instrument and protect panel face with cardboard strips.

d. Place instrument and inner container in a heavy carton or wooden box and seal with strong tape or metal bands.

e. Mark shipping container with "Delicate Instrument", "Fragile" etc.

Note

If instrument is to be shipped to Hewlett-Packard for service or repair, attach to the instrument a tag identifying the owner and indicate the service or repair to be accomplished; Include the model number and full serial number of instrument. In any correspondence, identify the instrument by model number and serial number prefix.

SECTION III OPERATION

3-1. INTRODUCTION.

3-2. The Model 203A generates two sine wave and two square wave signals which are available simultaneously at the front panel OUTPUT connectors. The output signal frequency is determined by the position of the FREQUENCY dial and FREQUENCY MULTIPLIER switch. By the use of the PHASE LAG control, the phase of the VARIABLE PHASE OUTPUT signals (one sine wave and one square wave) can be continuously adjusted from 0° to 360° with respect to the REFERENCE PHASE OUTPUT signals. The OUTPUT terminals provide an open-circuit signal level of 30 volts peak-to-peak. The individual AMPLITUDE controls provide 40 db of attenuation for each output signal. The CAL ADJ control provides a means of calibrating the FREQUENCY dial with the line frequency.

3-3. CONTROLS AND INDICATORS.

3-4. Figure 3-1 describes the function of all front panel controls, connectors, and indicators. The description of each component is keyed to a drawing which is included within the figure.

3-5. OPERATING INSTRUCTIONS.

3-6. Figure 3-2 contains operating procedures keyed to a drawing included in the figure. Refer to figure 3-1 for the function of each control and paragraph 2-3 for setting the line voltage switch.

3-7. CALIBRATION FOR 60 CYCLE LINE FREQUENCY.

3-8. Before using the Model 203A, calibrate the FREQUENCY dial with the line frequency as follows:

- a. Perform steps 1 and 2 of figure 3-2.
- b. Adjust the CAL ADJ control for minimum flicker rate of the LINE switch pilot lamp.

Note

When the FREQUENCY MULTIPLIER switch is in the CAL position, there is no output signal at the REFERENCE PHASE OUTPUT connector.

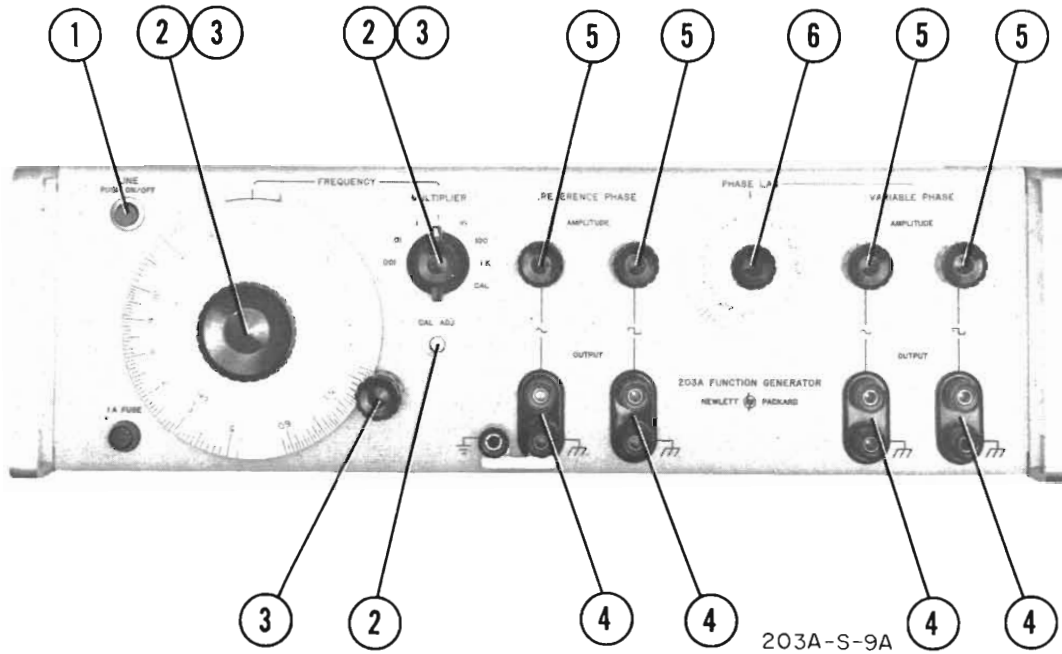

3-9. CALIBRATION FOR LINE FREQUENCIES OTHER THAN 60 CYCLES.

3-10. For line frequencies other than 60 cps the FREQUENCY dial is set to 1/10 of the line frequency (40 to 400 cps line frequency). Again the calibration is made with the front panel CAL ADJ control, which is adjusted for a minimum flicker rate of the pilot lamp. For line frequencies above 600 cps the FREQUENCY dial is set to 1/30 of the line frequency (33.3 for a 1000 cps line frequency). At the higher line frequencies the flicker intensity decreases and the CAL ADJ control sensitivity increases.

|---|---|

Figure 3-1. Front Panel Description

1. Push LINE switch ON, pilot lamp glows.
2. Set FREQUENCY dial and MULTIPLIER switch to CAL position. Refer to paragraph 3-7 for calibration procedure.
3. Set FREQUENCY dial and MULTIPLIER switch to desired output frequency. Use vernier control on FREQUENCY dial for fine frequency adjustments.

4. Select the desired test signal(s) and connect load to OUTPUT connector(s).
5. Set AMPLITUDE control(s) for desired signal level.
6. Set PHASE LAG control for desired degree of phase lag of the VARIABLE PHASE test signal(s) with respect to the REFERENCE PHASE test signal(s).

Figure 3-2. Operating Instructions

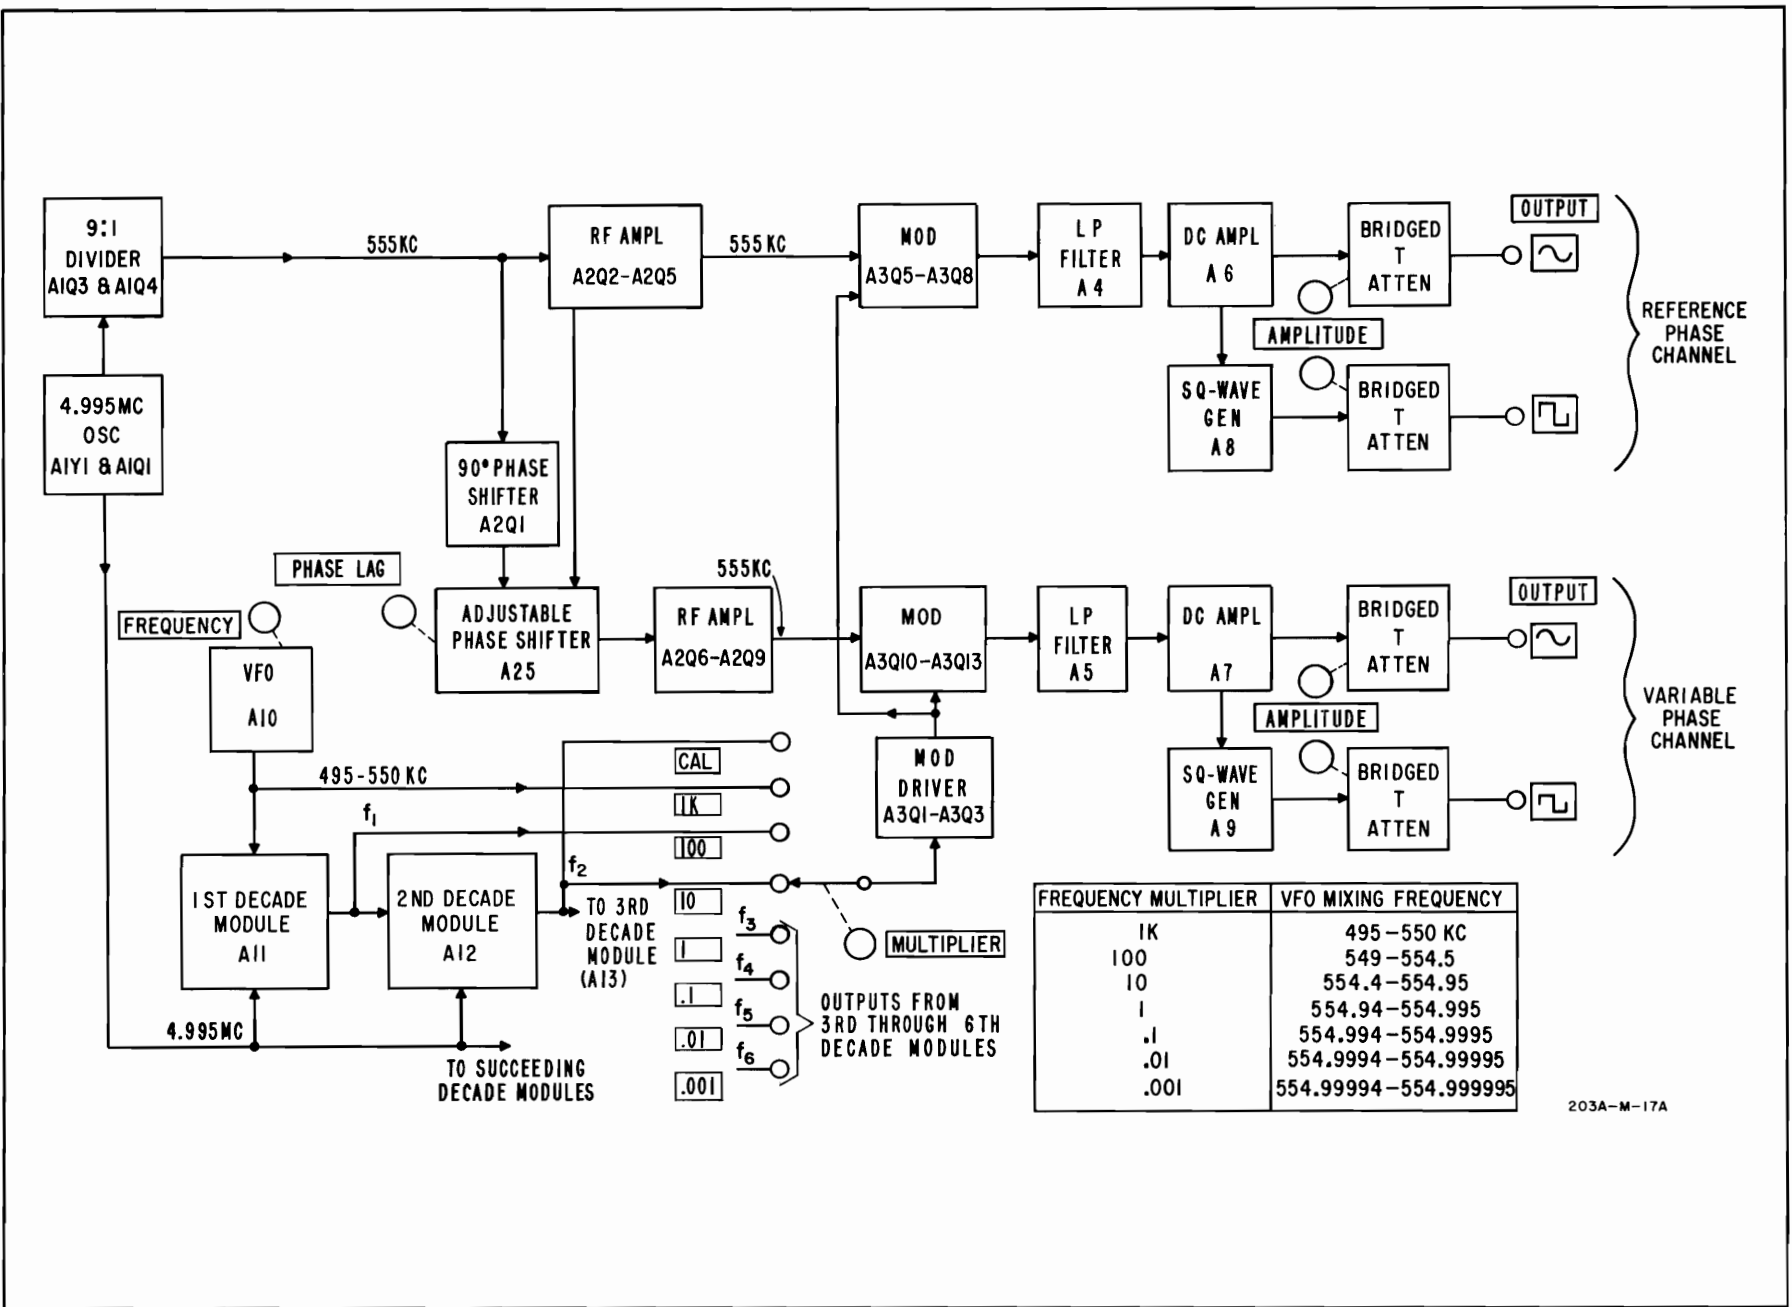

Figure 4-1. Block Diagram

203A-M-17A

SECTION IV

PRINCIPLES OF OPERATION

4-1. OVERALL DESCRIPTION.

4-2. This section describes how the Model 203A Variable Phase Function Generator operates. The block diagram, figure 4-1, shows the main sections and the signal flow within the Model 203A.

4-3. The Model 203A is a beat-frequency oscillator which, by mixing two high-frequency signals, generates signals in the frequency range of 0.005 cps to 60 kc (refer to paragraph 1-5 for options). One of the high-frequency signals is a fixed frequency; the other is variable. The Model 203A has two signal channels, REFERENCE PHASE and VARIABLE PHASE, each of which produces a sine-wave signal and a square-wave signal. The two channels are electrically similar except that the VARIABLE PHASE channel contains a continuously adjustable phase-shifting circuit which changes the phase relationship of the VARIABLE PHASE OUTPUT with respect to the REFERENCE PHASE OUTPUT. The four signals (two reference phase and two variable phase) are available simultaneously at the OUTPUT connectors.

4-4. The fixed frequency signal, which is generated by a crystal oscillator, is applied to both channels and routed to a modulator through a RF Amplifier within each channel. The variable frequency signal is applied directly to the modulator of each channel. The frequency of the variable frequency signal is controlled by the position of the FREQUENCY dial and the setting of the FREQUENCY MULTIPLIER switch. These two signals are mixed in the modulator and the difference in frequency between the two signals is the output frequency of the Model 203A.

4-5. CRYSTAL OSCILLATOR AND DIVIDER ASSEMBLY (A1).

4-6. Assembly A1 consists of a crystal controlled oscillator and a 9:1 frequency divider. Refer to the schematic diagram, figure 5-10, for circuit details.

4-7. CRYSTAL OSCILLATOR.

4-8. The oscillator (A1Y1 and A1Q1) is a crystal controlled grounded base Colpitts oscillator. The output is applied through buffer amplifier A1Q1, for isolation, to the base of the 9:1 frequency divider.

4-9. 9:1 FREQUENCY DIVIDER.

4-10. The 9:1 divider consists of a divider A1Q3 and a tank circuit which consists of A1C8, A1C9, A1C11, and A1L2. The divider is basically a class C grounded base Colpitts oscillator.

4-11. Two things occur during each cycle of the divider operation. One is amplitude modulation of the signal applied to the base of A1Q3, and the second is a mixing action within A1Q3. Each function occurs at

a different time during each cycle of oscillation and together tend to synchronize A1Q3 with a sub-multiple frequency of the frequency applied to the base of the divider.

4-12. Divider A1Q3 operates in the region of voltage saturation for a portion of each cycle. During the saturation period, the impedance between the base and collector of A1Q3 becomes very low; for the rest of cycle the impedance between the base and collector is relatively high. The variation in impedance between base and collector of A1Q3 results in amplitude modulation (about 10%) of the signal on the base of the divider. This amplitude modulation creates sidebands at the 8th and 10th harmonic of the divider oscillating frequency.

4-13. The signal applied to the base of A1Q3 is 4.995 Mc which is generated by the crystal oscillator circuit. The tank circuit of the 9:1 divider is tuned so that A1Q3 is oscillating at the 9th sub-multiple frequency of 4.995 Mc (555 kc).

4-14. The mixing process within A1Q3 occurs at the time during each cycle when the divider just starts to conduct. During this short time, the 8th and 10th harmonic of the 555 kc signal are mixed with the 9th harmonic resulting in a frequency component at 555 kc which influences the oscillations of A1Q3. The result is that A1Q3 stays synchronized to the 9th sub-harmonic of 4.995 Mc.

4-15. The pi type tank circuit filters out harmonic frequencies which may be present at the collector of A1Q3. A buffer amplifier A1Q4 provides further filtering, isolation, and power gain. The output of the 9:1 divider is a 555 kc signal and is coupled by A1T2 to A2Q1 and A2Q2 (see figures 5-10 and 5-12).

4-16. VARIABLE PHASE SHIFTER ASSEMBLY.

4-17. The variable phase shifter assembly A25 (figure 5-12) is a goniometer consisting of two stator windings, a rotor winding, and associated circuits. The goniometer requires two 555 kc input signals; one from A2Q2 to one of the stator windings, and the other from A2Q1 and the 90° phase shift network to the other stator winding. The output phase corresponds to the angle of the rotor winding (PHASE LAG control). The phase can be continuously adjusted from 0° through 360° with respect to the reference signal while maintaining a constant amplitude. The adjustable phase shifter output is applied to the RF amplifier assembly A2 (figure 5-12).

4-18. RF AMPLIFIERS (A2).

4-19. The RF amplifier assembly A2 consists of two RF amplifiers; A2Q3, A2Q4, and A2Q5 for the reference phase channel and A2Q6 through A2Q9 for

the variable phase channel. Refer to the schematic diagram (figure 5-12) for circuit details.

4-20. VARIABLE PHASE CHANNEL RF AMPLIFIER.

4-21. The signal from the variable phase shifter is amplified by A2Q6, then applied to the base of A2Q7. A2Q7 and A2Q8 act as an over-driven amplifier which amplifies and clips the signal applied to the base of A2Q7; this operation produces a square wave of current at the collector of A2Q8. The zero crossing of the square wave of current coincides with the zero crossing of the sine wave signal applied to the base of A2Q7 so that the phase of the applied signal is preserved. A tuned network, formed by A2C24, A2C25, A2C29, A2C30, A2L7, and A2T2 filters the 555 kc square-current waveform to a nearly pure sine wave.

4-22. The output of the RF amplifier circuit, which is taken across A2C30, is maintained at a constant amplitude by the level controlling circuit. If the output should increase, the voltage at A2C27 increases, resulting in a voltage increase at the base of A2Q9. This increase is applied to the bases of A2Q7 and A2Q8 which then conduct less average current. When A2Q8 conducts less, the signal at its collector decreases and the output voltage decreases, opposing the original change. The result is that the amplitude of the output remains nearly constant despite variations in the amplitude of the input signal. The output signal is then applied to A3T3 in the modulator assembly A3 (figure 5-16).

4-23. REFERENCE PHASE CHANNEL RF AMPLIFIER.

4-24. The signal present at the emitter of A2Q2 is applied to the reference phase channel RF amplifier section, A2Q3 through A2Q5. This stage operates

the same as the variable phase channel RF amplifier described in paragraph 4-20. The output signal is then applied to A2T4 in the modulator assembly A3 (figure 5-16).

4-25. VARIABLE FREQUENCY OSCILLATOR (A10).

4-26. The variable frequency oscillator assembly A10 generates a signal that is variable from 495 kc to 550 kc by rotation of the front panel FREQUENCY dial. The FREQUENCY dial is calibrated so that with the dial set at 5 the VFO is oscillating at 550 kc and with the dial set at 60 the VFO is oscillating at 495 kc. The output signal from the variable frequency oscillator is applied to the 1 K position of the MULTIPLIER (frequency range) switch and also to the 1st decade module. Refer to the schematic diagram, figure 5-14, for circuit details.

4-27. DECADE MODULES (A11-A16).

4-28. The six decade module assemblies A11 thru A16 each consist of a mixer, a bandpass filter, and a 10:1 divider. These decades produce a band of high frequency signals that are mixed in the modulators (A3) with the 555 kc fixed frequency signal from the RF amplifiers to produce a signal in the 0.005 cps to 60 kc range (refer to paragraph 1-5 for options). Refer to the schematic diagram, figure 5-14 and figure 4-2 for circuit details.

4-29. DECADE MODULE (A11).

4-30. The 4.995 Mc signal from the crystal oscillator is applied to the emitter of A11Q1 isolation stage, and subsequently appears across the primary of A11T1. The signal from A11T1 is applied to a suppressed carrier, balanced modulator. The 495 kc VFO signal (assume

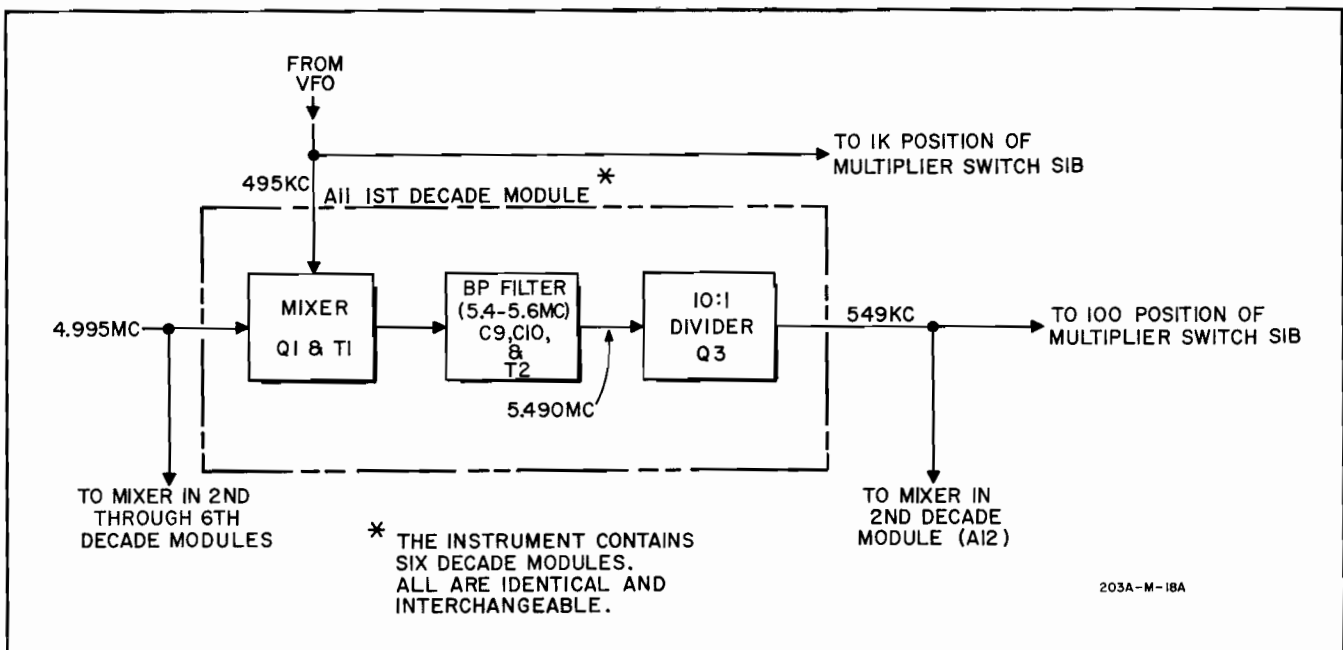

Figure 4-2. Circuit Details

that the FREQUENCY dial is at 60 and the VFO signal is 495 kc) is applied to the other input of the balanced modulator. Both signals are mixed, and the sum and difference of these two frequencies will appear at the output. The signal from the balanced modulator is passed through an LC filter network which is tuned for a band-pass of from 5.4 Mc to 5.6 Mc, which only allows the sum frequency to pass on to the 10:1 divider A11Q3. The 10:1 divider is similar to the 9:1 divider described in paragraph 4-9; the main difference being that the tuned tank circuit in the 10:1 divider is adjusted so that the stage provides an exact 10:1 division of the input frequency. The resultant frequency is fed to the 100 position of the FREQUENCY MULTIPLIER switch and to the mixer in the second decade module A12.

4-31. DECADE MODULES, A12 THROUGH A16.

4-32. The action within the succeeding decade modules is the same as that described for the first decade module A11. The output of each module is applied to a position of the FREQUENCY MULTIPLIER switch and to the mixer in the following decade module. Thus a set of variable frequency signals are produced and when mixed with the constant high-frequency signal in the modulator (A3) a beat frequency is produced. The beat frequency is decreased by a factor of 10 for each lower range of the FREQUENCY MULTIPLIER switch.

4-33. MODULATOR ASSEMBLY, A3.

4-34. The Modulator assembly A3 consists of a modulator drive amplifier and two balanced switching type modulators; one for the REFERENCE PHASE channel, and the other for the VARIABLE PHASE channel. Refer to the schematic diagram, figure 5-16, for details.

4-35. MODULATOR DRIVER AMPLIFIER.

4-36. The frequency selected by the FREQUENCY dial and the FREQUENCY MULTIPLIER is applied to the input of the modulator driver amplifier A3Q1 where it is amplified and applied to A3Q2 and A3Q3. A3Q2 and A3Q3 act as an over driven amplifier which amplifies and clips the signal applied to the base of A3Q2. This operation produces a square wave output at the collector of A3Q3 which is applied to the modulator section as a switching signal.

4-37. REFERENCE PHASE CHANNEL MODULATOR.

4-38. The modulator driving signal (VFO) and decade output) is applied to the bases of the switching transistors (A3Q5 thru A3Q8). The fixed frequency, a 555 kc sine wave, is applied through series resistors to the emitters of the switching transistors. The output at the collectors is sine wave of the sum and difference frequencies. This signal is applied to the low pass filter assembly A4 (figure 5-18). The filter passes only the difference frequency, the output is a sine wave having a frequency that is between 0.005 cps and 60 kc depending on the position of the FREQUENCY MULTIPLIER switch and the FREQUENCY dial setting

(refer to paragraph 1-5 for Options). The output signal is applied to the dc amplifier A6.

4-39. A dc reference voltage is derived by summing the signals at the collectors of A3Q5 and A3Q6. This dc reference voltage is used as a reference voltage for the differential amplifier in the dc amplifier assembly A6.

4-40. VARIABLE PHASE CHANNEL MODULATOR.

4-41. The variable phase channel modulator operates the same as the reference phase channel described in paragraph 4-37, except that the output is applied to the Low Pass Filter A5 and then to the dc amplifier A7.

4-42. DC AMPLIFIER ASSEMBLIES A6 AND A7.

4-43. After passing through the low pass filter the signal is fed to the direct coupled amplifiers; A6 for the reference phase channel, and A7 for the variable phase channel. Refer to the schematic diagrams figures 5-18 and 5-20 for circuit details.

4-44. REFERENCE PHASE CHANNEL DC AMPLIFIER ASSEMBLY.

4-45. The dc amplifier uses a differential amplifier for the input stage. The dc reference voltage from the modulator section is used as the reference input for the differential amplifier. This configuration minimizes any tendency of dc drift due to power supply of temperature variations. The dc amplifier circuit uses negative feedback to provide for low distortion amplification. The output is applied to a bridged-T type attenuator and the square wave generator A8.

4-46. VARIABLE PHASE CHANNEL DC AMPLIFIER ASSEMBLY.

4-47. The variable phase channel dc amplifier operates the same as the reference phase channel described in paragraph 4-44, except that the output is applied to bridged-T type attenuator and the square wave generator, A9.

4-48. SQUARE WAVE AMPLIFIER ASSEMBLIES A8 AND A9.

4-49. The output sine wave from the dc amplifier is applied to a square wave generator section, A8, for the REFERENCE PHASE channel, and A9 for the VARIABLE PHASE channel. Refer to the schematic diagrams, figures 5-18 and 5-20, for circuit details.

4-50. REFERENCE PHASE CHANNEL SQUARE WAVE GENERATOR.

4-51. The sine wave from the dc amplifier is amplified by A8Q1 then applied to the base of A8Q2. A8Q2 and A8Q3 act as an over driven amplifier which ampli-

fies and clips the signal applied to the base of A8Q2, and produces a square wave at the collector of A8Q3. This square wave is applied to A8Q4 and A8Q5 which form a Schmitt trigger circuit. The Schmitt trigger is a regenerative circuit which changes states abruptly when the input signal crosses a specific dc triggering signal crosses a specific dc triggering level. The output from this stage is a square wave having a rise time of less than 0.2 microsecond with the same frequency and phase as the sine wave signal applied to the circuit. The output is applied to a bridged-T attenuator.

4-52. VARIABLE PHASE CHANNEL SQUARE WAVE GENERATOR.

4-53. The variable phase channel square wave generator operates the same as the reference phase channel described in paragraph 4-50.

4-54. DC POWER SUPPLY A21, A22.

4-55. The dc power supply provides regulated +15, -15, and -24.5 volts and unregulated +35 volts.

4-56. CALIBRATE FEATURE.

4-57. The Model 203A has a feature that permits calibration of the FREQUENCY dial with the line frequency. To calibrate the Model 203A for 60 cps, the FREQUENCY dial is set to 6 (CAL) and the FREQUENCY MULTIPLIER switch is set to the CAL position. The calibration is made with the front panel CAL ADJ control, which slightly affects the VFO frequency. When the Model 203A frequency approaches the 60 cps line frequency the 60 cps square wave and the 60 cps beat with each other causing the pilot light to flicker. The Model 203A CAL ADJ should be made for a minimum rate of flicker.

SECTION V MAINTENANCE

5-1. REQUIRED TEST EQUIPMENT.

5-2. Recommended test equipment for troubleshooting and performance checking is listed in table 5-1. Test instruments other than those listed may be used if their specifications equal or exceed the required characteristics.

5-3. PERFORMANCE CHECKS.

5-4. Use the following front panel procedures to verify proper operation of the  Model 203A. The Model 203A and test equipment should be operated at 115/230 vac unless otherwise specified. If the Model 203A is found to exceed specifications at any point in this procedure, refer to paragraph 5-12, ADJUSTMENTS.

5-5. FREQUENCY DIAL CALIBRATION.

a. Push Model 203A LINE switch ON. Pilot light should glow.

b. Set FREQUENCY dial to 6 (CAL); MULTIPLIER switch to CAL.

c. Adjust front panel CAL ADJ until visual zero beat is obtained on front panel pilot light. This occurs when flashing rate of the pilot light approaches zero.

d. Connect Model 203A as shown in figure 5-1.

e. Rotate FREQUENCY dial and observe Electronic Counter readings at points shown in table 5-2; counter readings should be within limits shown. At frequencies below 100 cps use period measurements.

Table 5-1. Required Test Equipment

Instrument Type	Required Characteristics	Use	Recommended Model
DC Voltmeter	Voltage Range: 0 - 50 volts Input Impedance >10 M ohms Accuracy: ±1%	Performance Checks	 Model 412A
AC Voltmeter	Voltage Range: 1 mv - 100 v Freq. Response: to 600 kc Accuracy: ±2%	Performance Checks	 Model 403B or  Model 400D/H/L
Oscilloscope	Bandwidth: DC - 5 mc	Waveform Checking	 Model 175A with  Model 1780A Horizontal Plug-In  Model 1750A Vertical Plug-In  Model 10003A 10:1 Probe
Frequency Counter	Range: 0.005 cps - 60 kc	Performance Checks	 Model 523C
Distortion Analyzer	Range: 20 cps to 20 kc	Performance Checks	 Model 330B
Variable Transformer	Output Voltage: 103 - 127 vac	Performance Checks	Powerstat
6 pin printed board extender		Troubleshooting Adjustment	 #5060-0651
15 pin printed board extender		Troubleshooting Adjustment	 #5060-0047
Thermal 50Ω Converter	1 VAC input, 7.0 mv DC output ±0.2% 5 cps - 60 kc	Frequency Response	 Model 11051A
Nylon Tuning Wand		Adjustment	 #8730-0016
Soldering Iron and Tips	50 watts Tip Temperature: 800°F Tip Size: 1/16" - 3/32" Round Tip Dia: 3/4"	Troubleshooting Repair	Ungar No. 776 handle with Ungar No. PL333 tiptlet and Ungar No. 885 3/4" cups tip

Figure 5-1. Frequency Dial Calibration

This table can be used at all MULTIPLIER switch settings by changing the decimal point of the given counter reading.

5-6. FREQUENCY RESPONSE.

- a. Set Model 203A controls as follows:
- | | |
|----------------------|-----|
| FREQUENCY | 10 |
| MULTIPLIER | 100 |

CAUTION

INSURE THAT ALL FOUR AMPLITUDE CONTROLS ARE FULLY COUNTERCLOCKWISE TO AVOID DAMAGE TO THE THERMAL CONVERTER.

- b. Connect Model 203A as shown in figure 5-2, using very short leads between the Model 203A and Thermal Converter.

Figure 5-2. Frequency Response

Table 5-2. Frequency Dial Calibration

FREQUENCY Dial	Counter Period Measurement (below 100 cps)		Counter Frequency Measurement (above 100 cps)	
	Minimum	Maximum	Minimum	Maximum
5	1980	2020	495	505
6	1650	1684	594	606
7	1415	1443	693	707
8	1238	1263	793	808
9	1100	1122	891	909
10	990	1010	990	1010
12	825	841	1188	1212
14	707	721	1386	1414
17	582	594	1683	1717
20	495	505	1980	2020
25	396	404	2475	2525
30	330	336	2970	3030
40	247	253	3960	4040
50	198	202	4950	5050
60	165	169	5940	6060

c. Set REFERENCE PHASE ~ OUTPUT for a reading of 5.3 vac on the ac voltmeter.

CAUTION

DO NOT EXCEED THIS VALUE AS THE THERMAL CONVERTER IS VERY EASILY DAMAGED BY EXCESSIVE INPUT VOLTAGE.

d. Disconnect AC Voltmeter.

e. Adjust REFERENCE PHASE ~ OUTPUT for dc voltmeter reading of 7.0 millivolts.

f. Vary Model 203A FREQUENCY from 5 cps to 60 kc.

g. DC voltmeter reading should stay between 6.86 and 7.14 millivolts.

h. Repeat steps b thru g for VARIABLE PHASE ~ OUTPUT.

j. Disconnect resistor, thermal converter and dc voltmeter.

5-7. SINE WAVE CHECK.

a. Connect Model 203A as shown in figure 5-3.

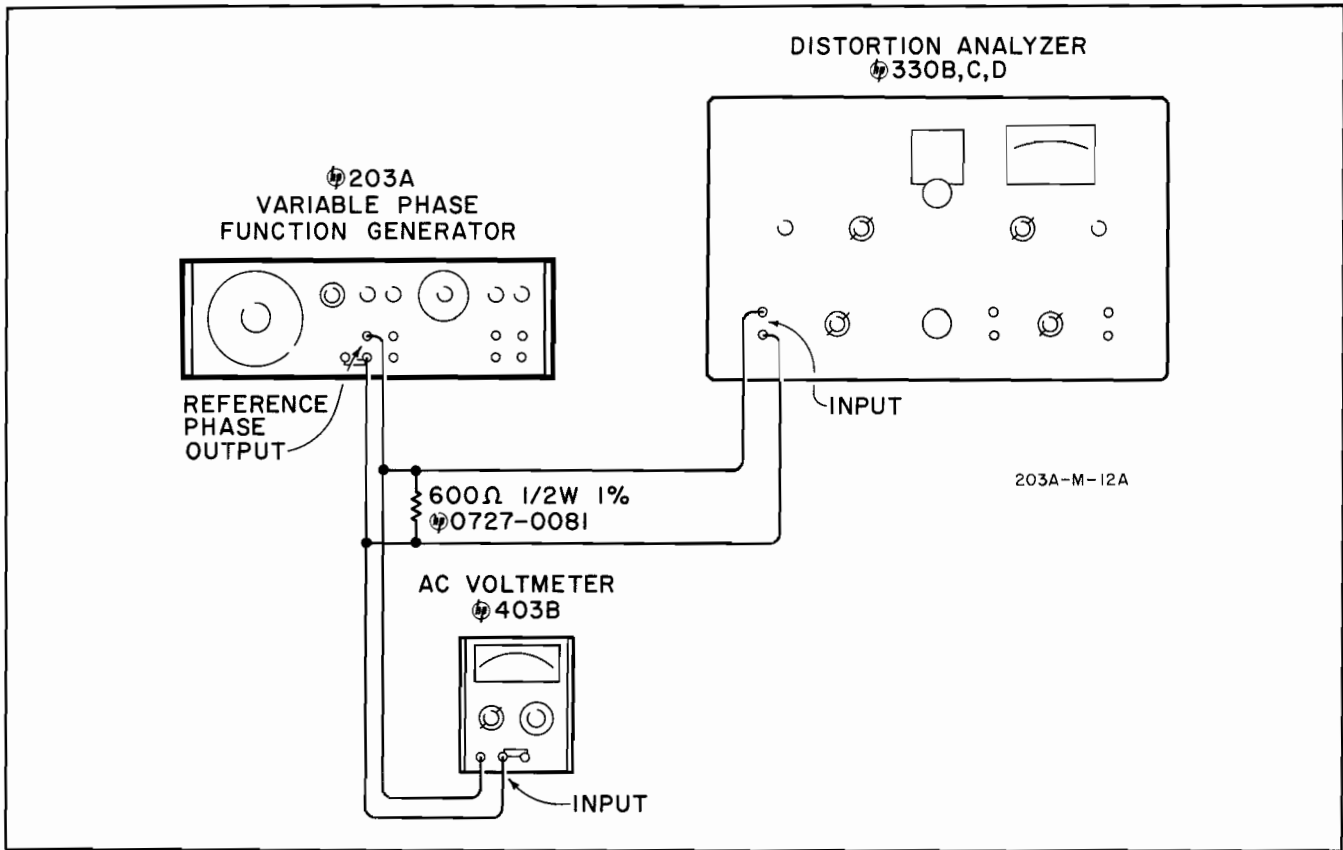

Figure 5-3. Sine Wave Check

b. Set Model 203A controls as follows:

- FREQUENCY 10
- MULTIPLIER 100
- ~ AMPLITUDE (2) both CW

c. AC Voltmeter should read at least 5.3 volts rms.

d. Using Distortion Analyzer, check total harmonic distortion present on signal. Distortion level should be more than 64 db (0.06%) below fundamental frequency reference level.

e. Repeat step g at a number of frequencies between 20 cps and 20 kc.

f. Repeat steps a through e for VARIABLE PHASE ~ OUTPUT.

Figure 5-4. Square Wave Check

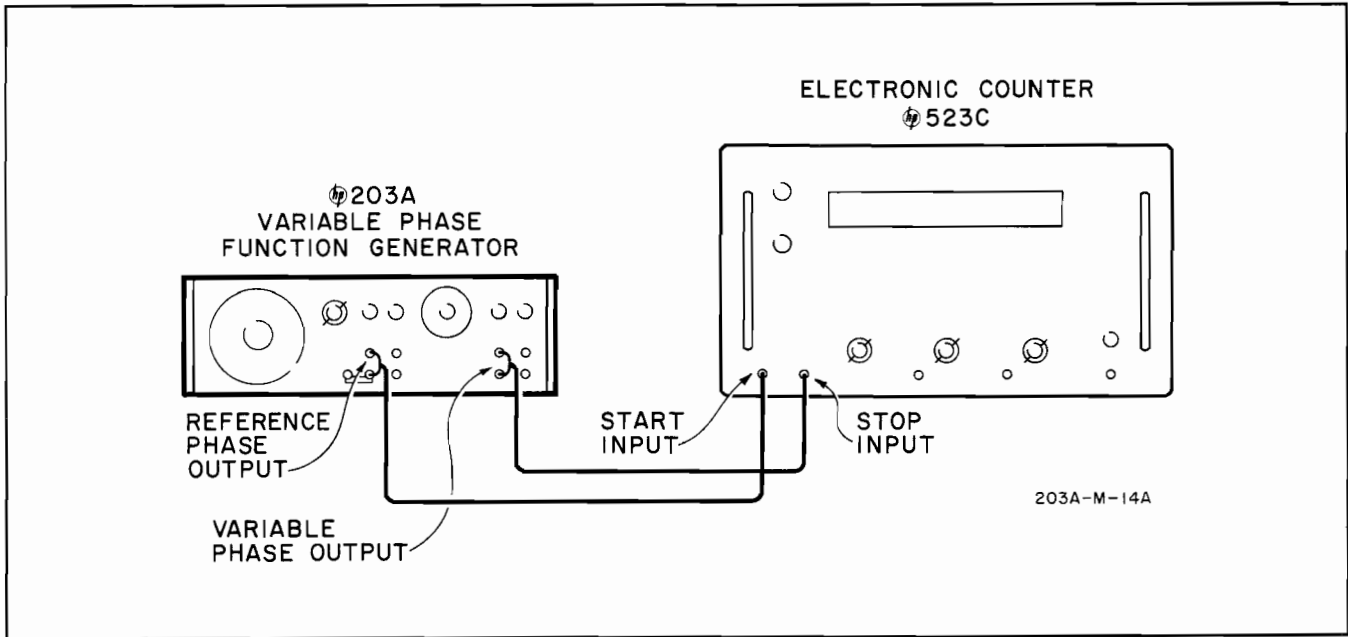

Figure 5-5. Phase Lag Check

5-8. SQUARE WAVE CHECK.

- a. Connect Model 203A as shown in figure 5-4 .
- b. Set instrument controls as follows:

Model 203A

FREQUENCY 10
 MULTIPLIER 100
 □ AMPLITUDE (2). both CW

Oscilloscope

INPUT DC
 SENSITIVITY5 V/CM
 SWEEP TIME1 MSEC/CM
 TRIGGER SOURCE INT
 TRIGGER SLOPE (+)

c. Adjust Model 203A FREQUENCY dial so that one cycle of square wave fills exactly 10 cm of horizontal deflection.

d. Zero crossing of square wave should occur between 4.8 and 5.2 cm from start of sweep. Peak-to-peak voltage should be at least 15 volts.

e. Set Oscilloscope SENSITIVITY to .05 V/CM. Adjust VERTICAL POSITION to bring flat top of square wave into view.

f. Flat top of the square wave should not vary more than ±75 millivolts (±1.5 mm) from 10% to 90% of half period.

g. Set Oscilloscope SWEEP TIME to .1 μSEC/CM; SENSITIVITY to .5 V/CM.

h. Square wave rise time should be less than 0.2 μsec from 10% to 90% points.

j. Set Oscilloscope TRIGGER SLOPE to (-).

k. Square wave fall time should be less than 0.2 μsec from 10% to 90% points.

m. Repeat steps b thru k at various frequencies on all ranges.

n. Repeat steps a thru m for VARIABLE PHASE □ OUTPUT.

5-9. PHASE LAG CHECK.

- a. Connect Model 203A as shown in figure 5-1.
- b. Set instrument controls as follows:

Model 203A

MULTIPLIER 10
 FREQUENCY approximately 27
 ~ AMPLITUDE both CW

Electronic Counter

FUNCTION SELECTOR PERIOD
 STD. FREQ. COUNTED 1 MC

c. Adjust Model 203A FREQUENCY dial for Electronic Counter reading of 3600.

d. Connect Model 203A as shown in figure 5-5.

e. Set Electronic Counter controls as follows:

FUNCTION TIME INTERVAL
 TRIGGER INPUT SEP
 TRIGGER SLOPE both (+)

- f. Set Model 203A PHASE LAG dial to 180°.
- g. Adjust Electronic Counter TRIGGER LEVEL controls for stable reading near 1800.
- h. Check Electronic Counter readings at 30° increments on PHASE LAG dial. Readings should be within the values shown in table 5-3.

Table 5-3. Phase Lag Check

PHASE LAG	ELECTRONIC COUNTER	
	Minimum	Maximum
0	3550	50
30	250	350
60	550	650
90	850	950
120	1150	1250
150	1450	1550
180	1750	1850
210	2050	2150
240	2350	2350
270	2650	2750
300	2950	3050
330	3250	3350

5-10. INSTRUMENT COVER REMOVAL.

5-11. To remove either the top or bottom covers, unscrew and remove the two counter-sunk Phillips-head screws which secure the cover to the instrument. Then slide the cover toward the rear of the instrument. To replace the cover, reverse the procedure.

5-12. ADJUSTMENTS.

513. The following test and adjustment procedures should be performed only if it has been definitely determined by the Performance Checks given in paragraphs 5-5 thru 5-9 that the Model 203A is out of adjustment.

5-14. POWER SUPPLY A22 ADJUSTMENTS.

- a. Supply Model 203A primary power from Variable Transformer.
- b. Set line voltage to nominal value (115 volts).
- c. Connect DC Voltmeter and AC Voltmeter to A22 (5). (See figure 5-21.)
- d. Adjust A22R12 (-15 volt adjust) for DC Voltmeter reading of -15.1 vdc. AC Voltmeter should read less than 0.4 mv ripple.
- e. Vary line voltage from 103 to 127 vac. DC Voltmeter reading should not change more than ±0.2 vdc.
- f. Connect DC Voltmeter and AC Voltmeter to A33 (13).
- g. Adjust A22R20 (+15 volt adjust) for DC Voltmeter reading of +15.1 dc. The AC Voltmeter should read less than 0.4 mv ripple.

h. Vary line voltage from 103 to 127 vac. DC Voltmeter reading should not change more than ±0.2 vdc.

j. Connect DC Voltmeter and AC Voltmeter to A22 (2).

k. AC Voltmeter should read less than 1.0 mv ripple. DC Voltmeter should read -24.5 ±0.5 vdc.

Note

It may be possible to bring the -24.5 volt supply into specifications by a slight adjustment of the -15 volt adjust (A22R12). The -15 volt supply must stay between -14.9 and -15.3 vdc.

m. Vary line voltage from 103 to 127 vac. DC Voltmeter reading should not change more than ±0.4 vdc.

n. Connect DC Voltmeter to A22 (14).

p. DC Voltmeter should read +35 ±5 vdc.

q. Disconnect front panel shorting bar.

r. Connect AC Voltmeter between chassis ground and circuit common A22 (9).

s. Use an insulated tuning wand to adjust A21C1 (located on bottom of chassis) for a minimum reading (refer to figure 5-8).

5-15. 4.995 MC OSCILLATOR AND 9:1 DIVIDER (A1) ADJUSTMENT.

a. Connect 10:1 probe of Oscilloscope to base of A1Q3 and ground lead to ground plane of oscillator board. (See figure 5-9.)

b. Set Oscilloscope controls as follows:

INPUT AC
SENSITIVITY05 V/CM
SWEEP TIME 2 μSEC/CM

c. Adjust A1T1 for maximum amplitude of 5 mc signal.

d. Move 10:1 probe to emitter of A1Q3.

e. Adjust A1L2 for eleven waveforms in 10 cm of horizontal deflection. Adjust A1L2 so that the first pip of signal is slightly larger than the rest (see figure 5-7, Waveforms 3 - 5).

f. Repeat steps a thru e until optimum adjustment is obtained.

g. Move probe to A1 (5).

h. Adjust A1T2 for maximum amplitude of 555 kc signal.

5-16. ADJUSTABLE PHASE SHIFTER (A25) ADJUSTMENT.

Note

The following procedure must be performed with printed board A2 in its normal operating position in the Model 203A. Do not use an extender board.

a. Connect AC Voltmeter across output of Phase Shifter Assembly (A25) using short unshielded leads (see figure 5-8).

b. While rotating PHASE LAG dial through 360° alternately adjust A2C2 (see figure 5-11) and A25C1 until voltage level indicated on AC Voltmeter remains with ±1% of nominal signal level obtained.

5-17. RF AMPLIFIER ADJUSTMENT (A2).

a. Connect DC Voltmeter to the collector of A2Q3; connect 10:1 Oscilloscope probe to collector of A2Q4. (See figure 5-11.)

b. Adjust A2L3 for maximum DC Voltmeter reading.

c. Adjust A2T1 for minimum AC voltage indication on Oscilloscope.

d. Repeat steps b and c as many times as necessary for optimum adjustment.

e. Connect DC Voltmeter to collector of A2Q7; connect 10:1 Oscilloscope probe to collector of A2Q8.

f. Adjust A2L7 for maximum DC Voltmeter reading.

g. Adjust A2T2 for minimum AC Voltage indication on Oscilloscope.

h. Repeat steps f and g as many times as necessary for optimum adjustment.

5-18. DECADE MODULE (A11-A16) ADJUSTMENTS.

Note

Each of the six Decade Modules, A11 thru A16 are electrically identical. All adjustments are made with the board in the A11 position. Upon completion of the adjustment, return the board to its original position. All components are referred to by their location on the board. For example, L1 is A11L1, A12L1, A13L1, etc. depending upon the particular board under test.

a. Connect 10:1 probe of Oscilloscope to junction of C4 and R5 (see figure 5-13) and set controls as follows:

- SENSITIVITY05 V/CM
- SWEEP TIME 2 μSEC/CM
- TRIGGER SOURCE INT

b. Set Model 203A FREQUENCY dial to 30; MULTIPLIER switch to 100.

c. Adjust T1 for maximum 5 mc signal amplitude as observed on Oscilloscope. (See figure 5-7, Waveform 8.)

d. Move 10:1 Oscilloscope probe to base of Q3. (See figure 5-7, Waveform 9.)

e. Alternately adjust L1 and T2 for maximum amplitude of the 5 mc signal.

f. Move 10:1 Oscilloscope probe to emitter of Q3.

g. Adjust L2 until eleven stable periods of the observed signal are present across the face of the oscilloscope (10 cm). (See figure 5-7, Waveforms 10 - 13). Vary the adjustment of L2 noting both clockwise and counter-clockwise limits between which the observed signal remains stable. Set L2 exactly midway between noted limits for optimum adjustment of Decade Module.

h. Repeat steps a thru f for each of the remaining Decade Modules, performing the adjustments with the Decade Module in the All position. After adjustments are made, return each Decade Module to its respective position.

5-19. FREQUENCY DIAL ADJUSTMENT.

a. Connect Model 203A as shown in figure 5-1.

b. Set MULTIPLIER switch to 1 K.

c. Check each FREQUENCY dial setting listed in table 5-2. If at any point the frequency lies outside the specified tolerance, adjust C11 by carefully bending its outer plates until the frequency is within the given tolerance.

5-20. MODULATOR (A3) ADJUSTMENT.

a. Connect DC Voltmeter to A3 (12). (See figure 5-15.)

b. Adjust A3R13 for minimum DC Voltmeter reading (typically between +50 and -50 millivolts).

c. Measure voltage at A3 (4); reading should not exceed 250 mv.

5-21. DISTORTION.

a. Connect Distortion Analyzer and 600 ohm, 1% resistor, (Ⓢ #0727-0081) REFERENCE PHASE ~ OUTPUT terminals.

b. Set FREQUENCY dial to 5; MULTIPLIER to 1 K.

c. Set PHASE LAG dial to obtain maximum distortion reading on Distortion Analyzer.

d. Adjust A3R17 for minimum distortion. (See figure 5-15.)

e. Connect Distortion Analyzer and 600 ohm resistor to VARIABLE PHASE ~ OUTPUT terminals.

f. Set PHASE LAG dial to obtain maximum distortion reading.

g. Adjust A3R31 for minimum distortion.

Note

Perform steps h thru r only if distortion is greater than 64 db (0.06%) below reference level. These steps will reduce only excessive eighth and tenth harmonics.

h. Connect 10:1 Oscilloscope probe to emitter of A11Q3. Connect probe ground lead to A11 ground plane. (See figure 5-13.)

j. Set Oscilloscope controls as follows:

INPUT AC
 SENSITIVITY 0.05 V/CM
 SWEEP TIME 2 μSEC/CM

k. Adjust A11T1, A11L1 and A11T2 for a minimum reading on Distortion Analyzer.

Note

Do not adjust A11T1, A11L1 and A11T2 more than one complete turn from previous setting.

m. Adjust A11L2 so the first pip of the 5 mc synchronizing frequency is larger than the rest. (See figure 5-7 and Waveforms 10 - 13).

n. Repeat steps a thru m as necessary to obtain minimum distortion.

p. Interchange A11 and A12.

q. Repeat steps h through n for A12.

r. Repeat steps p and q for A13, A14, and A15 and A16 each time with the new boards in A11 position.

5-22. FREQUENCY RESPONSE.

a. Connect DC Voltmeter to REFERENCE PHASE ~ OUTPUT terminals.

b. Set FREQUENCY dial to 50, MULTIPLIER to 100 and both ~ AMPLITUDE controls fully clockwise.

c. Adjust A6R8 (A7R8 for VARIABLE PHASE) (DC Zero Adj) for minimum DC Voltmeter reading (typically between +20 and -20 millivolts). (See figure 5-17.)

d. Disconnect DC Voltmeter.

e. Turn all AMPLITUDE controls fully counter-clockwise.

f. Connect Model 203A as shown in figure 5-2 using short leads between Thermal Converter and Model 203A.

Note

Do not place DC Amplifiers (A6 and A7) on extender board.

g. Set REFERENCE PHASE ~ AMPLITUDE for AC Voltmeter reading of 5.3 vac.

CAUTION

DO NOT EXCEED THIS VALUE AS THERMAL CONVERTER IS VERY EASILY DAMAGED BY EXCESSIVE INPUT VOLTAGES.

h. Disconnect AC Voltmeter.

j. Carefully adjust REFERENCE PHASE~AMPLITUDE for a DC Voltmeter reading of 7.0 millivolts.

k. Set Model 203A MULTIPLIER switch to 1.

m. Adjust A3R20 (A3R34 for VARIABLE PHASE) (50 cps adj) until the DC Voltmeter reads 7.0 millivolts.

n. Set MULTIPLIER switch to 10. Note DC Voltmeter reading.

p. Set MULTIPLIER switch to 1 K.

q. Adjust A4R2 (A5R2 for VARIABLE PHASE) (50 kc adj) until DC Voltmeter reads the same as in step n.

r. Repeat steps j thru q until readings at 50 cps, 500 cps and 50 kc are between 6.96 and 7.14 millivolts.

s. Repeat steps a thru r for the VARIABLE PHASE ~ OUTPUT.

t. Disconnect Thermal Converter and connect Oscilloscope to REFERENCE PHASE ~ OUTPUT terminals. Set REFERENCE PHASE ~ AMPLITUDE fully clockwise.

u. Adjust A6R20 (A7R20 for VARIABLE PHASE) (Amp. Adj) for 30 volt peak-to-peak deflection.

v. Repeat steps t and u for the VARIABLE PHASE ~ OUTPUT.

5-23. PHASE LAG DIAL.

a. Connect Model 203A as shown in figure 5-6.

b. Set FREQUENCY dial to 10; MULTIPLIER switch to 100. Set both ~ AMPLITUDE controls fully clockwise.

c. Adjust PHASE LAG dial and one (not both) of the ~ AMPLITUDE controls for minimum reading on AC Voltmeter. Typical reading is less than 100 mv.

d. Loosen set screws and slip PHASE LAG dial until it reads exactly 180° at the null obtained in step c and then tighten the set screws.

5-24. SQUARE WAVE (A8 and A9) ADJUSTMENT.

a. Connect DC Voltmeter to Model 203A REFERENCE PHASE ~ OUTPUT.

b. Set Model 203A controls as follows:
 FREQUENCY 10
 MULTIPLIER 100
 ~ AMPLITUDE both CW

Figure 5-6. Phase Lag Dial Adjustment

c. Adjust A8R9 for a minimum reading on dc voltmeter (typically between +50 and -50 millivolts). (See figure 5-17.)

d. Connect dc voltmeter to VARIABLE PHASE \square OUTPUT.

e. Adjust A9R9 for a minimum reading on dc voltmeter (typically between +50 and -50 millivolts).

5-25. TROUBLESHOOTING.

5-26. To locate trouble in the Model 203A, start with a thorough visual inspection of the instrument. Look for burned out or loose components and connections, and other similar condition which suggests a source of trouble. If visual inspection does not reveal the trouble, use Model 203A Block Diagram (figure 4-1), Troubleshooting Summary (table 5-4), and Typical Waveforms (figure 5-7) as aids for isolating the trouble.

5-27. PRINTED CIRCUIT BOARD REPAIR.

5-28. The Model 203A uses plated through double-sided etched circuit boards.

5-29. Observe the following rules when repairing double-sided etched circuit boards.

a. Solder from the conductor side of the etched circuit board.

b. Avoid applying excessive heat when soldering on the circuit board.

c. To remove a damaged component, clip component leads near the component; then apply heat and remove each lead with a straight upward motion.

d. Use a special tool to remove components having multiple connections, such as potentiometers, etc. Refer to table 5-1 for type of soldering tip required.

e. Use a toothpick to free hole of solder before installing a new component.

Table 5-4. Troubleshooting Summary

Symptoms	Possible Cause
Instrument ON, no output signals available, pilot light not lighted	Fuse , F1, 115/230 volt switch S3 Line switch S2, DC Power Supply
Instrument ON, no output signals available, pilot light lighted	DC Power Supply (A22)
DC Power Supply voltages normal, no output signals available	5 mc Oscillator and 9:1 Divider A1, and Variable Frequency Oscillator A10
Reference Phase Output signals normal, abnormal variable phase output signals	Adjustable Phase Shifter A25, RF Amplifier (A2Q6 - A2Q9, A2Q1) Modulator A3Q9 - A3Q13) Low Pass Filter, A5, DC Amplifier A7 Square Wave Generator A9 Output Attenuators
Variable Phase Output signals normal, abnormal Reference Phase Output signals	RF Amplifier (A2Q2 - A2Q5) Modulator (A3Q5 - A3Q8) Low Pass Filter A4, DC Amplifier A6 Square Wave Generator A8 Output Attenuators
Abnormal output signals on individual MULTIPLIER switch positions	Decade Module (A11 - A16) associated with highest MULTIPLIER switch position where abnormal condition first appears
Distorted ~ Output	RF Amplifier A2, Modulator A3 Low pass filters (A4 and A4) DC Amplifiers (A6 and A7)
Distorted Square Wave	Square Wave Generators (A8 and A9)
Amplitude of output signals varies with FREQUENCY dial setting	Modulator A3, Low Pass Filters (A4 and A5) DC Amplifiers (A6 and A7)
No phase control of Variable Phase Output signals	Adjustable Phase Shifter (A25)

SECTION VI REPLACEABLE PARTS

6-1. INTRODUCTION.

6-2. This section contains information for ordering replacement parts. Table 6-1 lists parts in alpha-numerical order of their reference designators and indicates the description and $\text{\textcircled{P}}$ stock number of each part, together with any applicable notes. Table 6-2 lists parts in alpha-numerical order of their $\text{\textcircled{P}}$ stock numbers and provides the following information on each part:

- a. Description of the part (see list of abbreviations below).
- b. Typical manufacturer of the part in a five-digit code (see list of manufacturers in Appendix).
- c. Manufacturer's stock number.
- d. Total quantity used in the instrument (TQ column).
- e. Recommended spare part quantity for complete maintenance during one year of isolated service is available upon request.

6-3. Miscellaneous parts not indexed in Table 6-1 are listed at the end of Table 6-2.

6-4. ORDERING INFORMATION.

6-5. To order a replacement part, address order or inquiry to your Hewlett-Packard Sales or Service Office. A map of all Hewlett-Packard field offices is provided in the Appendix of this manual.

6-6. Specify the following information for each part:

- a. Model and complete serial number of instrument.
- b. Hewlett-Packard stock number.
- c. Circuit reference designator.
- d. Description.

6-7. To order a part not listed in Table 6-1 and 6-2, give a complete description of the part and include its function and location.

REFERENCE DESIGNATORS

A = assembly	F = fuse	P = plug	V = vacuum tube, neon bulb, photocell, etc.
B = motor	FL = filter	Q = transistor	W = cable
C = capacitor	J = jack	R = resistor	X = socket
CR = diode	K = relay	RT = thermistor	XF = fuseholder
DL = delay line	L = inductor	S = switch	XDS = lampholder
DS = device signaling (lamp)	M = meter	T = transformer	Z = network
E = misc electronic part	MP = mechanical part		

ABBREVIATIONS

a = amperes	elect = electrolytic	mtg = mounting	rot = rotary
bp = bandpass	encap = encapsulated	my = mylar	rms = root-mean-square
bwo = backward wave oscillator	f = farads	NC = normally closed	rmo = rack mount only
c = carbon	fxd = fixed	Ne = neon	s-b = slow-blow
cer = ceramic	Ge = germanium	NO = normally open	Se = selenium
cmo = cabinet mount only	grd = ground (ed)	NPO = negative positive zero (zero temperature coefficient)	sect = section(s)
coef = coefficient	h = henries	nsr = not separately replaceable	Si = silicon
com = common	Hg = mercury		sil = silver
comp = composition	imp = impregnated		sl = slide
conn = connection	inca = incandescent	obd = order by description	td = time delay
crt = cathode-ray tube	ins = insulation (ed)		TiO ₂ = titanium dioxide
dep = deposited			tog = toggle
EIA = Tubes or transistors meeting Electronic Industries' Association standards will normally result in instrument operating within specifications; tubes and transistors selected for best performance will be supplied if ordered by $\text{\textcircled{P}}$ stock numbers.	K = kilo = 1000	p = peak	tol = tolerance
	lin = linear taper	pc = printed circuit board	trim = trimmer
	log = logarithmic taper	pf = picofarads = 10 ⁻¹² farads	twt = traveling wave tube
	m = milli = 10 ⁻³	pp = peak to peak	var = variable
	M = megohms	piv = peak inverse voltage	w/ = with
	ma = milliamperes	pos = position (s)	W = watts
	μ = micro = 10 ⁻⁶	pot = potentiometer	ww = wirewound
	minat = miniature		w/o = without
	mfgl = metal film on glass	rect = rectifier	* = optimum value selected at factory, average value shown (part may be omitted)
	mfr = manufacturer

A25C2, A25C3	0150-0118	C: fxd, cer, 200 pf $\pm 10\%$, 500 vdcw	
C1, C2	0180-0056	C: fxd, elect, 1000 μf , 50 vdcw	
C3	0170-0022	C: fxd, mylar, 0.1 μf $\pm 20\%$, 600 vdcw	
C4A, B	0150-0119	C: fxd, cer, 2 x 0.1 μf $\pm 20\%$, 250 vdcw	
C5 thru C10		Not assigned	
C11	0121-0117	C: var, air, 12.5 to 86.9 pf	
C12	0140-0202	C: fxd, dipped mica, 15 pf $\pm 5\%$, 500 vdcw	
C13	0160-0905	C: fxd, cer, 33 pf $\pm 2\%$, 600 vdcw	
C14	0160-0835	C: fxd, mica, 300 pf $\pm 1\%$, 100 vdcw	
C15	0121-0007	C: var, air, 3.6 pf to 26 pf, single sect	
DS1	2140-0058	Lamp, incandescent, 10 v at 0.040 amps	
F1	2110-0047	Fuse, 1 amp	
J1	1251-0148	Connector, power, receptacle, 3 pin male recessed chassis mounting	
J2 thru J5	0340-0086	Insulator, BP Double, without locating key	
	0340-0090	Insulator, BP, with locating key	
	1510-0006	Binding post, black, without solder turret	
	1510-0007	Binding post, red, without solder turret	
L1	9140-0230	Coil, fxd, inductance, 290 μh $\pm 1\%$	
L2	9140-0231	Coil, adjustable, inductance, 10.8 to 18.7 μh	
L3, L4	9140-0115	Coil, fxd R. F., 22 μh $\pm 10\%$	
Q1, Q2	1850-0039	Transistor, 2N383, PNP, germanium	
Q3	1850-0095	Transistor type 2N297A power, PNP germanium	
R1	0761-0054	R: fxd, met flm, 330 ohms $\pm 5\%$, 1 W	
R2, R3	0768-0001	R: fxd, met, 1000 ohms $\pm 10\%$, 3 W	
R4, R5	0764-0063	R: fxd, met flm, 620 ohms $\pm 5\%$, 2 W	
R6	2100-0113	R: var, comp, dual tandem, 2 W	
R7, R8	0757-0728	R: fxd, met flm, 619 ohms $\pm 1\%$, 1/4 W	
R9	2100-0113	R: var, comp, dual tandem, 2 W	
R10, R11	0757-0728	R: fxd, met flm, 619 ohms $\pm 1\%$, 1/4 W	
R12	2100-0113	R: var, comp, dual tandem, 2 W	
R13, R14	0757-0728	R: fxd, met flm, 619 ohms $\pm 1\%$, 1/4 W	
R15	2100-0113	R: var, comp, dual tandem, 2 W	
R16, R17	0757-0728	R: fxd, met flm, 619 ohms $\pm 1\%$, 1/4 W	
S1A, B, C	3100-0841	Switch, multiplier	
S1C1, S1C2	0160-0170	C: fxd, cer, 0.22 μf $+80\%$ -20% , 25 vdcw	
S2	3101-0107	Switch, pushbutton, lighted, SPDT	
S3	3101-0033	Switch, slide, DPDT, non-shorting, 0.5 amp, 125 VDC, 3 amp, 125 VAC

APPENDIX

CODE LIST OF MANUFACTURERS (Sheet 1 of 2)

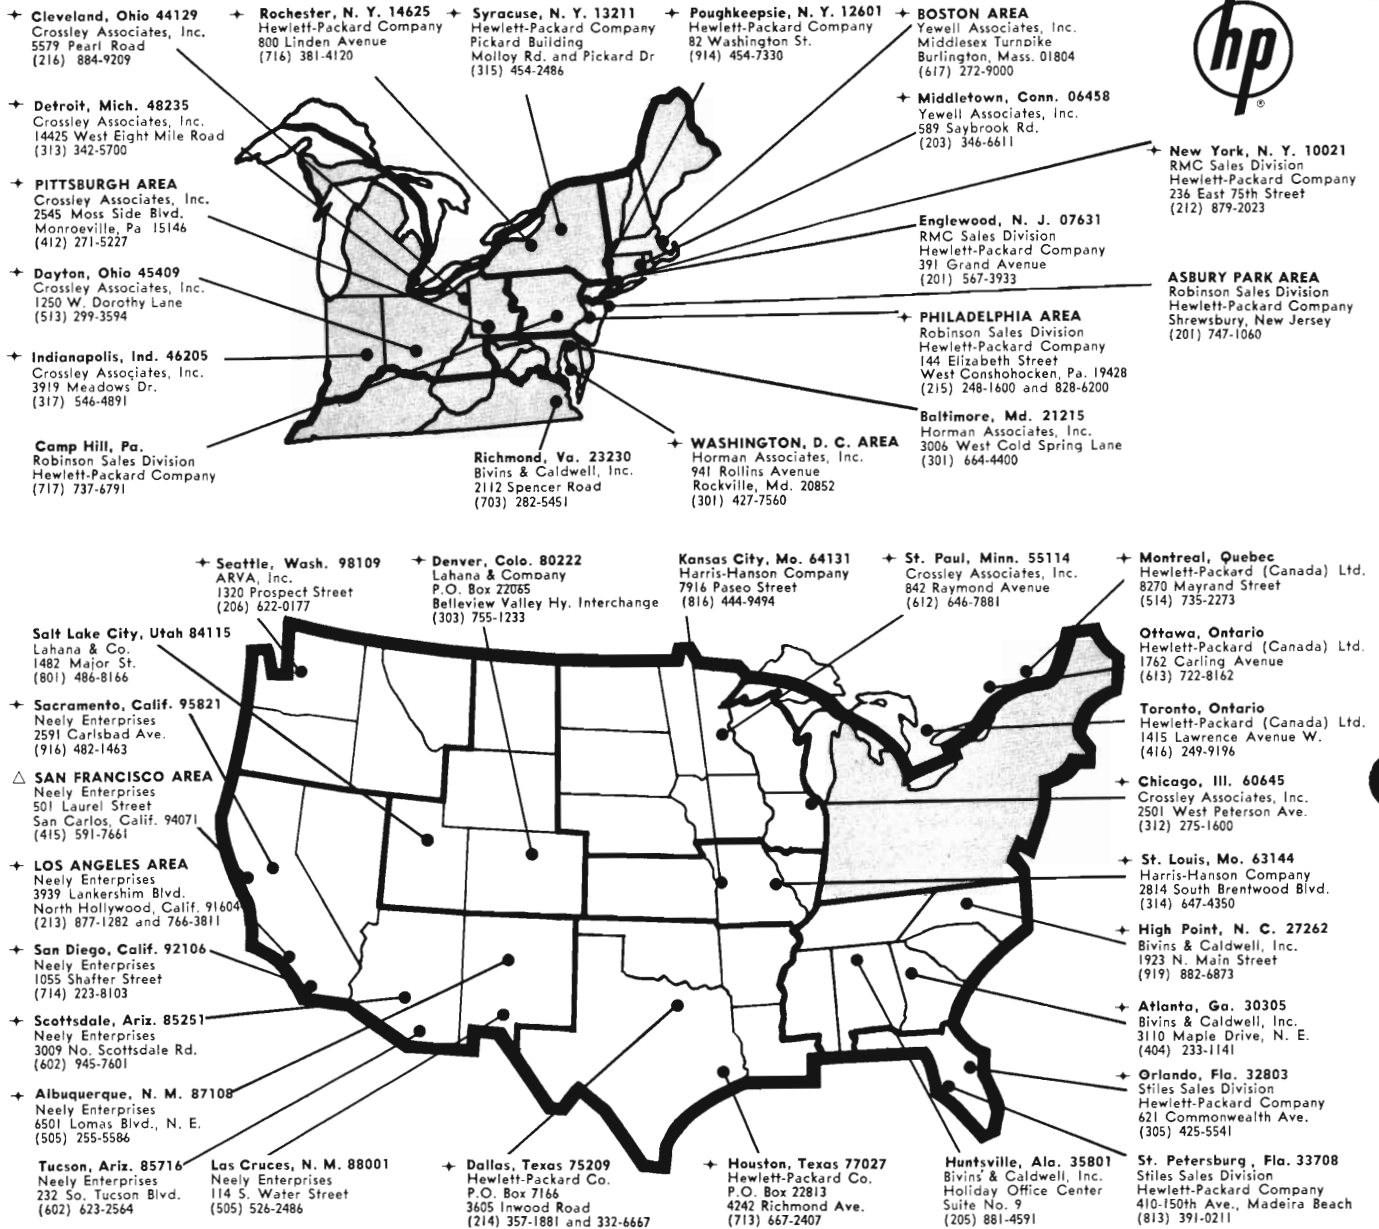

The following code numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H4-1 (Name to Code) and H4-2 (Code to Name) and their latest supplements. The date of revision and the date of the supplements used appear at the bottom of each page. Alphabetical codes have been arbitrarily assigned to suppliers not appearing in the H4 handbooks.

CODE NO.	MANUFACTURER	ADDRESS	CODE NO.	MANUFACTURER	ADDRESS	CODE NO.	MANUFACTURER	ADDRESS
00334	Humidial Co.	Colton, Calif.	07115	Corning Glass Works Electronic Components Dept.	Bradford, Pa.	40920	Miniature Precision Bearings, Inc.	Keene, N.H.
00335	Westrex Corp.	New York, N.Y.	07126	Digitran Co.	Pasadena, Calif.	42190	Muter Co.	Chicago, Ill.
00373	Garlock Packing Co., Electronic Products Div.	Camden, N.J.	07137	Transistor Electronics Corp.	Minneapolis, Minn.	43990	C. A. Norgren Co.	Englewood, Colo.
00656	Aerovox Corp.	New Bedford, Mass.	07138	Westinghouse Electric Corp. Electronic Tube Div.	Elmira, N.Y.	44655	Ohmite Mfg. Co.	Skokie, Ill.
00779	Amp, Inc.	Harrisburg, Pa.	07261	Avnet Corp.	Los Angeles, Calif.	47904	Polaroid Corp.	Cambridge, Mass.
00781	Aircraft Radio Corp.	Boonton, N.J.	07263	Fairchild Semiconductor Corp.	Mountain View, Calif.	48620	Precision Thermometer and Inst. Co.	Philadelphia, Pa.
00815	Northern Engineering Laboratories, Inc.	Burlington, Wis.	07910	Continental Device Corp.	Hawthorne, Calif.	49956	Raytheon Company	Lexington, Mass.
00853	Sangamo Electric Company, Ordill Division (Capacitors)	Marion, Ill.	07933	Rheem Semiconductor Corp.	Mountain View, Calif.	54294	Shallcross Mfg. Co.	Selma, N.C.
00866	Goe Engineering Co.	Los Angeles, Calif.	07966	Shockley Semi-Conductor Laboratories	Palo Alto, Calif.	55026	Simpson Electric Co.	Chicago, Ill.

WARRANTY

All our products are warranted against defects in materials and workmanship for one year from the date of shipment. Our obligation is limited to repairing or replacing products (except tubes) which prove to be defective during the warranty period. We are not liable for consequential damages.

For assistance of any kind, including help with instruments under warranty, contact your nearest Hewlett-Packard field office for instructions. Give full details of the difficulty and include the instrument model and serial numbers. Service data or shipping instructions will be promptly sent to you. There will be no charge for repair of instruments under warranty, *except transportation charges*. Estimates of charges for non-warranty or other service work will always be supplied, if requested, before work begins.

CLAIM FOR DAMAGE IN SHIPMENT

Your instrument should be inspected and tested as soon as it is received. The instrument is insured for safe delivery. If the instrument is damaged in any way or fails to operate properly, file a claim with the carrier or, if insured separately, with the insurance company.

SHIPPING

On receipt of shipping instructions, forward the instrument prepaid to the destination indicated. You may use the original shipping carton or any strong container. Wrap the instrument in heavy paper or a plastic bag and surround it with three or four inches of shock-absorbing material to cushion it firmly and prevent movement inside the container.

GENERAL

Your nearest Hewlett-Packard field office is ready to assist you in any situation, and you are always welcome to get directly in touch with Hewlett-Packard service departments:

CUSTOMER SERVICE

Hewlett-Packard Company
395 Page Mill Road
Palo Alto, California, 94306
U.S.A.
Telephone: (415) 326-3950

Cable: "HEWPACKSA"

MANUAL CHANGES

MODEL 203A

VARIABLE PHASE FUNCTION GENERATOR

Manual Serial Prefixed: 425-

Part No. 00203-90000

To adapt this manual to instruments with other serial prefixes check for errata below, and make changes shown in tables.

► New or Revised Item

Instrument Serial Prefix	Make Manual Changes	Instrument Serial Prefix	Make Manual Changes
ALL	ERRATA		
425-00126	1		
425-00151	1, 2		

Note: Part No. and Stock No. are synonymous.

ERRATA

Table 1-1, Specifications,

Change OUTPUT SYSTEM specifications to read as follows:

Direct coupled output is isolated from ground and may be operated floating or with either side grounded (Sine Wave only).

Change frequency range note to read:

*Two lower ranges of (Option:01) 0.0005 and (Option:02) 0.00005 cps are available on special order.

Paragraph 3-8,

Change the Note in step b to read as follows:

When the FREQUENCY MULTIPLIER switch is in the CAL position, there is no output signal at the REFERENCE PHASE OUTPUT connector.

Paragraph 5-14,

Precede step a with the following:

Note

Make the following adjustments with the FREQUENCY MULTIPLIER Switch in the X100 (or below) position.

Change last sentence in step d to read as follows:

AC Voltmeter should read less than 1.0 mv ripple.

Change last sentence in step g to read as follows:

The AC Voltmeter should read less than 1.0 mv ripple.

Change first sentence in step k to read as follows:

AC Voltmeter should read less than 2.0 mv ripple.

Figure 5-15.

Change designation on R31 and R34 to VAR. DIST. ADJ. and VAR. 50 CPS ADJ., respectively.

CHANGE #1

Table 6-2. Index by Reference Designator,

Change A2C2 to Stock No. 0160-0217, Capacitor, fixed, 2300 pf

Change A3Q4 and A3Q5 to Stock No. 1854-0039, 2N3053

Change A6Q5 to Stock No. 1854-0039, 2N3053

Change A8Q4 and A8Q5 to Stock No. 1854-0039, 2N3053

Change A21C2 to Stock No. 0140-0054, Capacitor, fixed, 100 pf

Change A22Q1 and A22Q5 to Stock No. 1854-0039, 2N3053

Instrument Serial Prefix	Make Manual Changes	Instrument Serial Prefix	Make Manual Changes
ALL	ERRATA		
425-00126	1		
425-00151	1, 2		

CHANGE #2 Table 6-1. Index by Reference Designator, Miscellaneous,

Change ϕ Stock No. 1251-0452 to 1251-1031

Add the following to Miscellaneous:

Option 01

00203-00203, Front Panel

00203-66501, Decade module board assembly

Option 02

00203-00204, Front Panel

00203-66501, Decade module board assembly

Change A8C3 to ϕ Stock No. 0140-0192, C: fxd, mica, 68 pf $\pm 5\%$, 300 vdcw.

Add * to A8C3 on schematic and change value to 68 pf.

Change S2 to ϕ Stock No. 3101-0100

ERRATA

► Table 6-1

Delete "EIA type 2N383" from Description column for transistors A8Q2, A8Q3, A22Q2, A22Q3, and A22Q4.

► Table 6-2, ϕ Part No. 1850-0040

Delete "EIA type 2N3831" from Description column and "SA591" from Mfr. Part No. column.

Add ϕ Part No. 1850-0040 to Mfr. Part No.
